Selection of Cuttings Removal

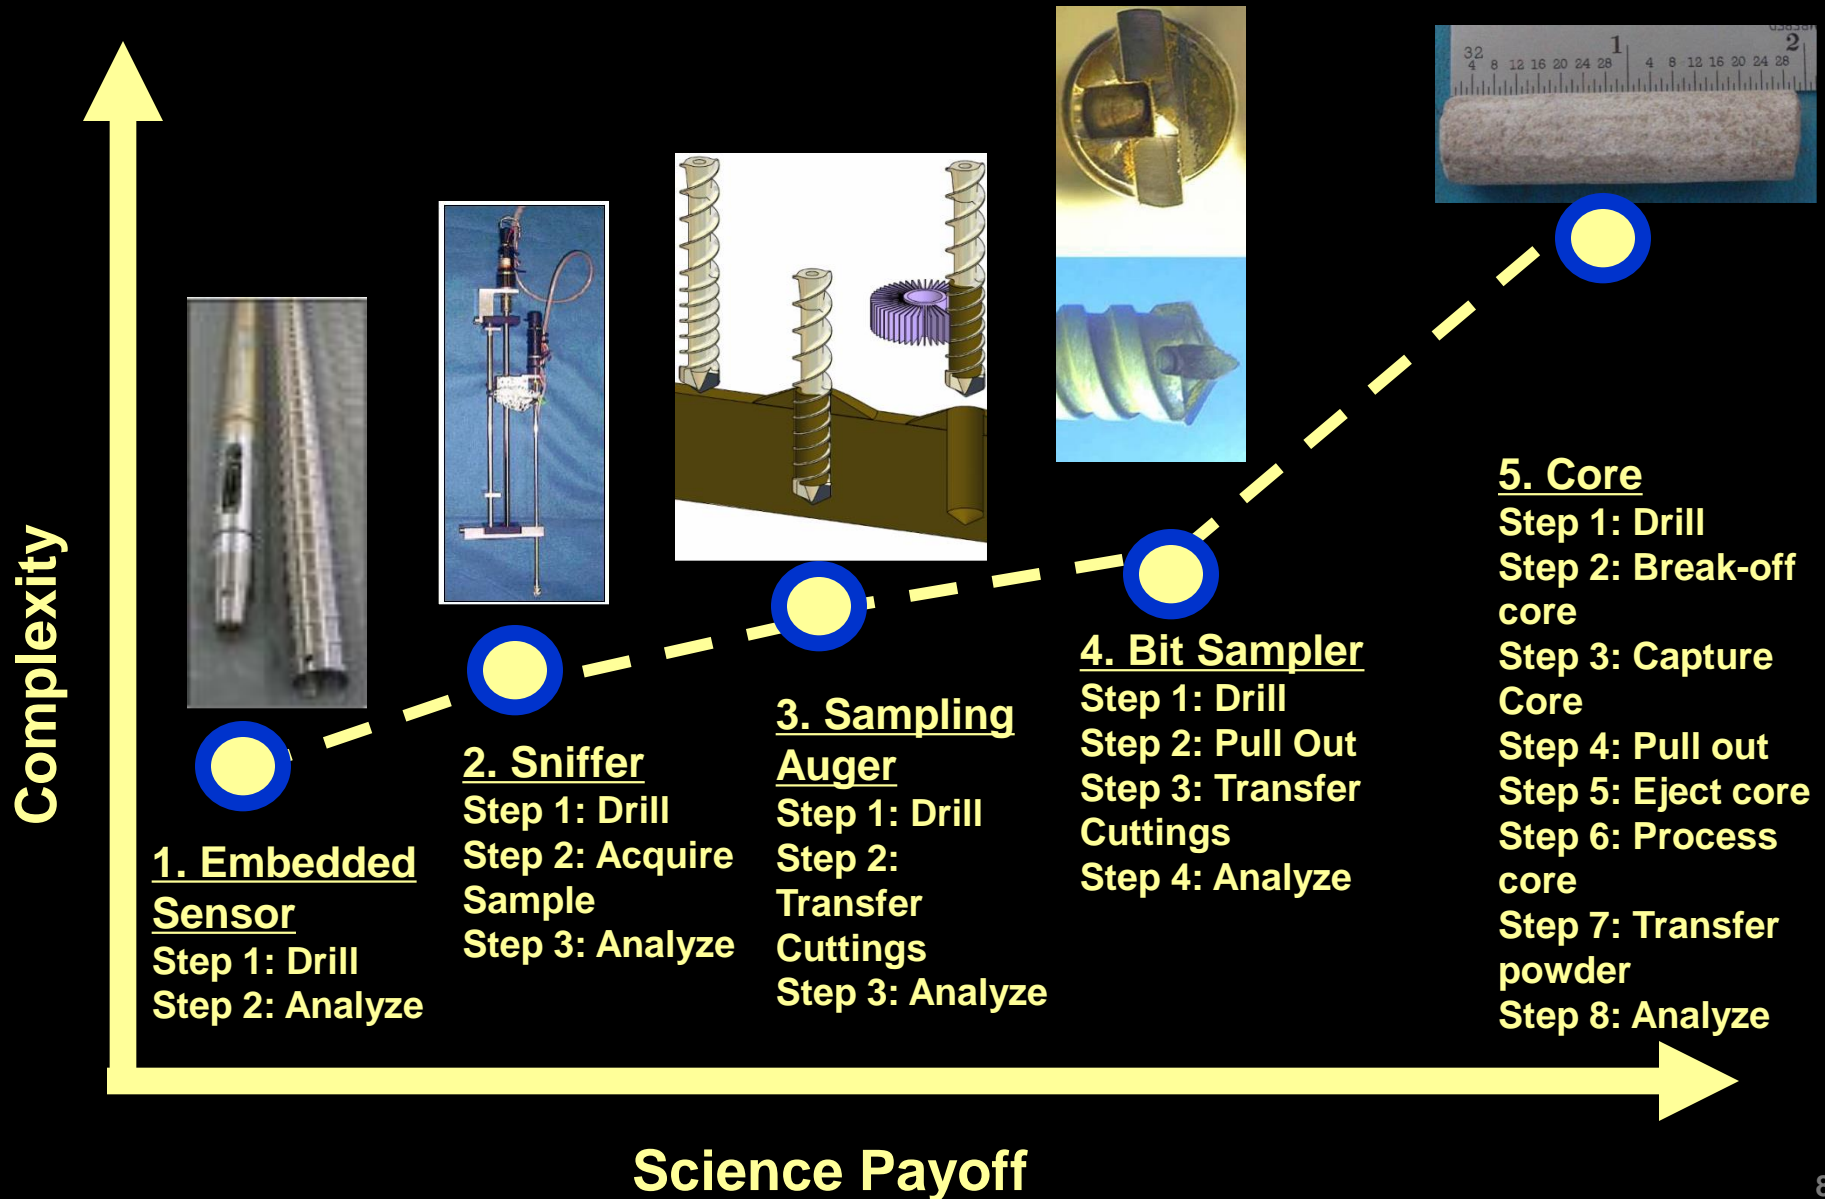

Drilling on Mars in Ice

- Drilling power \rightarrow heat \rightarrow latent heat \rightarrow sublimation
- Volumetric expansion of ice \rightarrow vapor 1000's x

Sampling Approaches

1. Embedded Sensor
 Step 1: Drill
 Step 2: Analyze

2. Sniffer
 Step 1: Drill
 Step 2: Acquire Sample
 Step 3: Analyze

3. Sampling Auger
 Step 1: Drill
 Step 2: Transfer Cuttings
 Step 3: Analyze

4. Bit Sampler
 Step 1: Drill
 Step 2: Pull Out
 Step 3: Transfer Cuttings
 Step 4: Analyze

5. Core
 Step 1: Drill
 Step 2: Break-off core
 Step 3: Capture Core
 Step 4: Pull out
 Step 5: Eject core
 Step 6: Process core
 Step 7: Transfer powder
 Step 8: Analyze

History of Planetary Drilling

Planetary "Deep" Drilling

Apollo Lunar Surface Drill (1971, 1972)

- ~500 Watt, Battery Powered, and Human Operated
- 3 m coring depth and 2.4 m HFP depth
- *A15: The drill was hard to remove from the hole...it took both astronauts working at the limit of their combined strengths to pull up the drill ...this caused a severe shoulder sprain in Scott.*

<http://www.hq.nasa.gov/alsj/tools/judy20.jpg>

Luna 16 (1970), 20 (1972), 24 (1976)

- Sample return missions
- Rotary-percussive
- Coring drill
- Supervised autonomy
- Depths of 35 cm, 25cm, & 2 m

<http://www.zarya.info/Diaries/Luna/Luna16.htm>

Mars Drilling

MER: Rock Abrasion Tool

- Grinds 4.5cm diameter, <5mm deep hole in rocks
- Removes dust and rock crust

Phoenix: Scoop and RASP

- First human-made hardware that touched extraterrestrial ice
- Scoop removes loose layer
- RASP acquired soil/ice from mm below the surface

MSL: Rotary-Percussive Drill

- 100 Watt, Rotary-Percussive
- Acquires powdered sample from ~ 5 cm depth.

2008 Mars Phoenix

~ 100 days
~ 300 kg
~ 2 kWhr/sol (solar)

TRL 5 (Rot Perc)

TRL 6 (Rot Perc)

"Bite" Sampling Concept

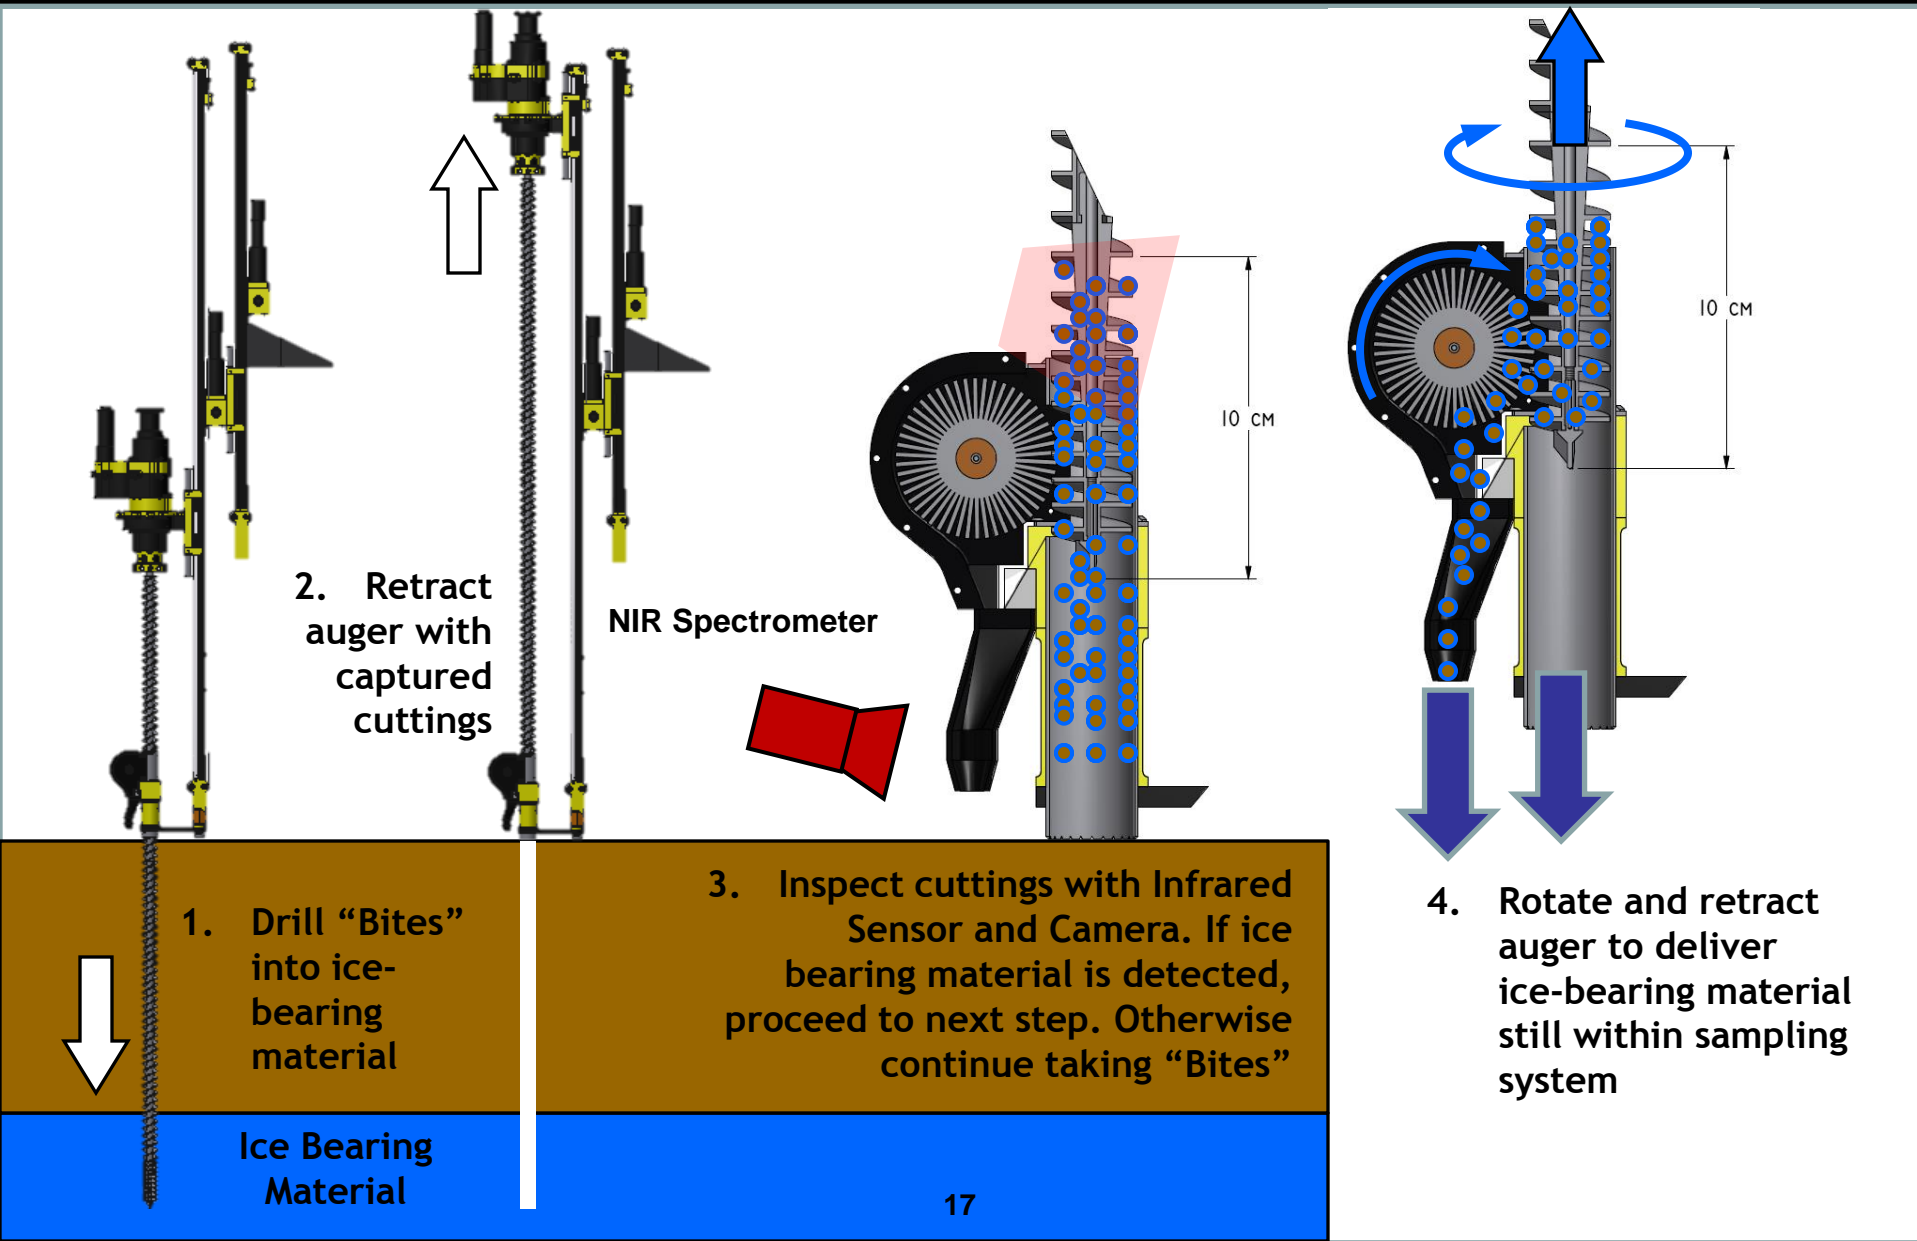

- Drill to 1 meter in short (~ 10 cm) "bites"
- Preserve stratigraphy in "bites"
- More accurate strength measurement of subsurface
- Lower risk ("graceful failure") – if stuck at 60 cm, 5 bites done
- Time for analysis while drill in 'safe' place (above the hole)
- Time for subsurface to cool down

Implementation of "Bite" Sampling

LITA drill

YUnAA9o

Resource Prospector (RP)

Goal:

- ISRU demo: Prospecting for volatiles, extraction of O₂ from lunar regolith

← Drill

→ Neutron Spectrometer Subsystem (NSS)

→ Near InfraRed Volatiles Spectrometer Subsystem (NIRVSS)

← Oxygen and Volatile Extraction Node (OVEN)

← Lunar Advanced Volatiles Analysis (LAVA)

Mars IceBreaker

- Tested in Antarctica, Arctic, Greenland
- Design with PP in mind
- Tested in Mars Chamber

Testing in University Valley, Antarctica

Dry Valleys: Ice Cemented Ground – Soil Did Not Stick!

Drilling Data (1-1-100-100):

- Power: ~ 70 Watt
- Time to 1 m: 54 min
- Weight on Bit: < 70 N
- Drill Energy: 63 Whr
- T_{Bit} : -5°C (T_{Ground} -19°C)

Desert Pavement

Antarctic Dry Valleys: Massive Ice

Drilling Data:

- Power ~ 150 Watt (at 2.5 m depth)
- Time to reach 1 m / 2.5 m: 1 hr / 2.5 hr
- Weight on Bit: < 70 Newton
- Energy: 120 Whr for 1 m / 300 Whr for 2.5 m
- T Bit-10 °C (T Ice -24 °C)

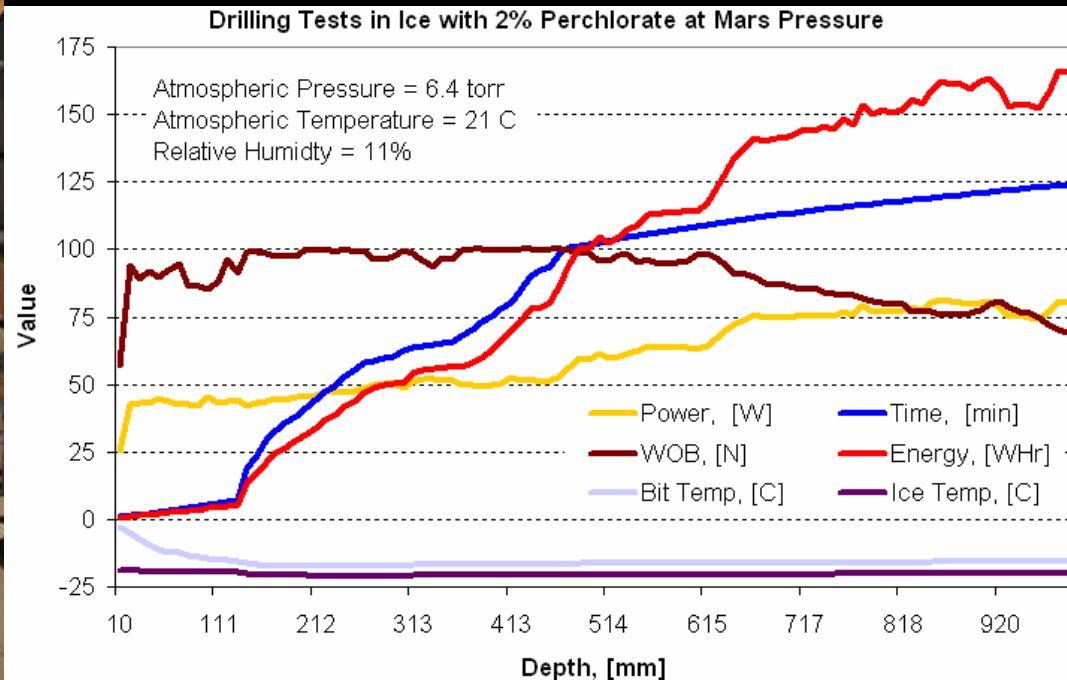

Ice cuttings include many single ice chucks as large as 6 mm long

Test in Mars chamber

- 1 m depth in 3.5 m chamber
- Tests in
 - ice (w and w/out perchlorate)
 - icy-soil
 - rock
- Drilling at 1-1-100-100 level: 1m in 1 hr with 100 Watt and 100 Newton WOB

10 m class drills

MARTE

- 10 m coring drill
- Core processing
- Instruments for core analysis
- ASTEP funded (PI. Carol Stoker)

MARTE
Limestone Drilling Test
NASA Ames Research Center
May 2005

Honeybee Robotics

STEM Drill

- Coiled up stem with a drill bit at the end
- Gas used to blow cuttings out
- Small form factor - large depth
- Designed for heat flow probe (S. Nagihara)
- Designed for seismic sensor (M. Siegler)

STEM Drill Testing

- Testing in compacted lunar soil simulant
- Tests done at Mars pressures
- 'drilled' 2 m in 2 min
- Can stop-start

100 m class drills

Melt probes

- Developed in 1960s and tested in Antarctica and Greenland
- Simple but slow, power hungry, mostly one way (down), inefficient, doesn't work well in sediments and non-icy formations
- k of cryogenic ice is 4x higher (difficult to warm up ice)
- Need integrated heat (e.g. Pu=238) or wires and power on the surface
- Examples:
 - Philbert probe (CRREL)
 - Cryobot (CalTech/JPL)
 - Ice Diver (Univ. of Washington)
 - VALKYRIE (Stone Aerospace)

Philbert, 1966

Hecht et al., 2003

Treffer et al., 2003

(b)

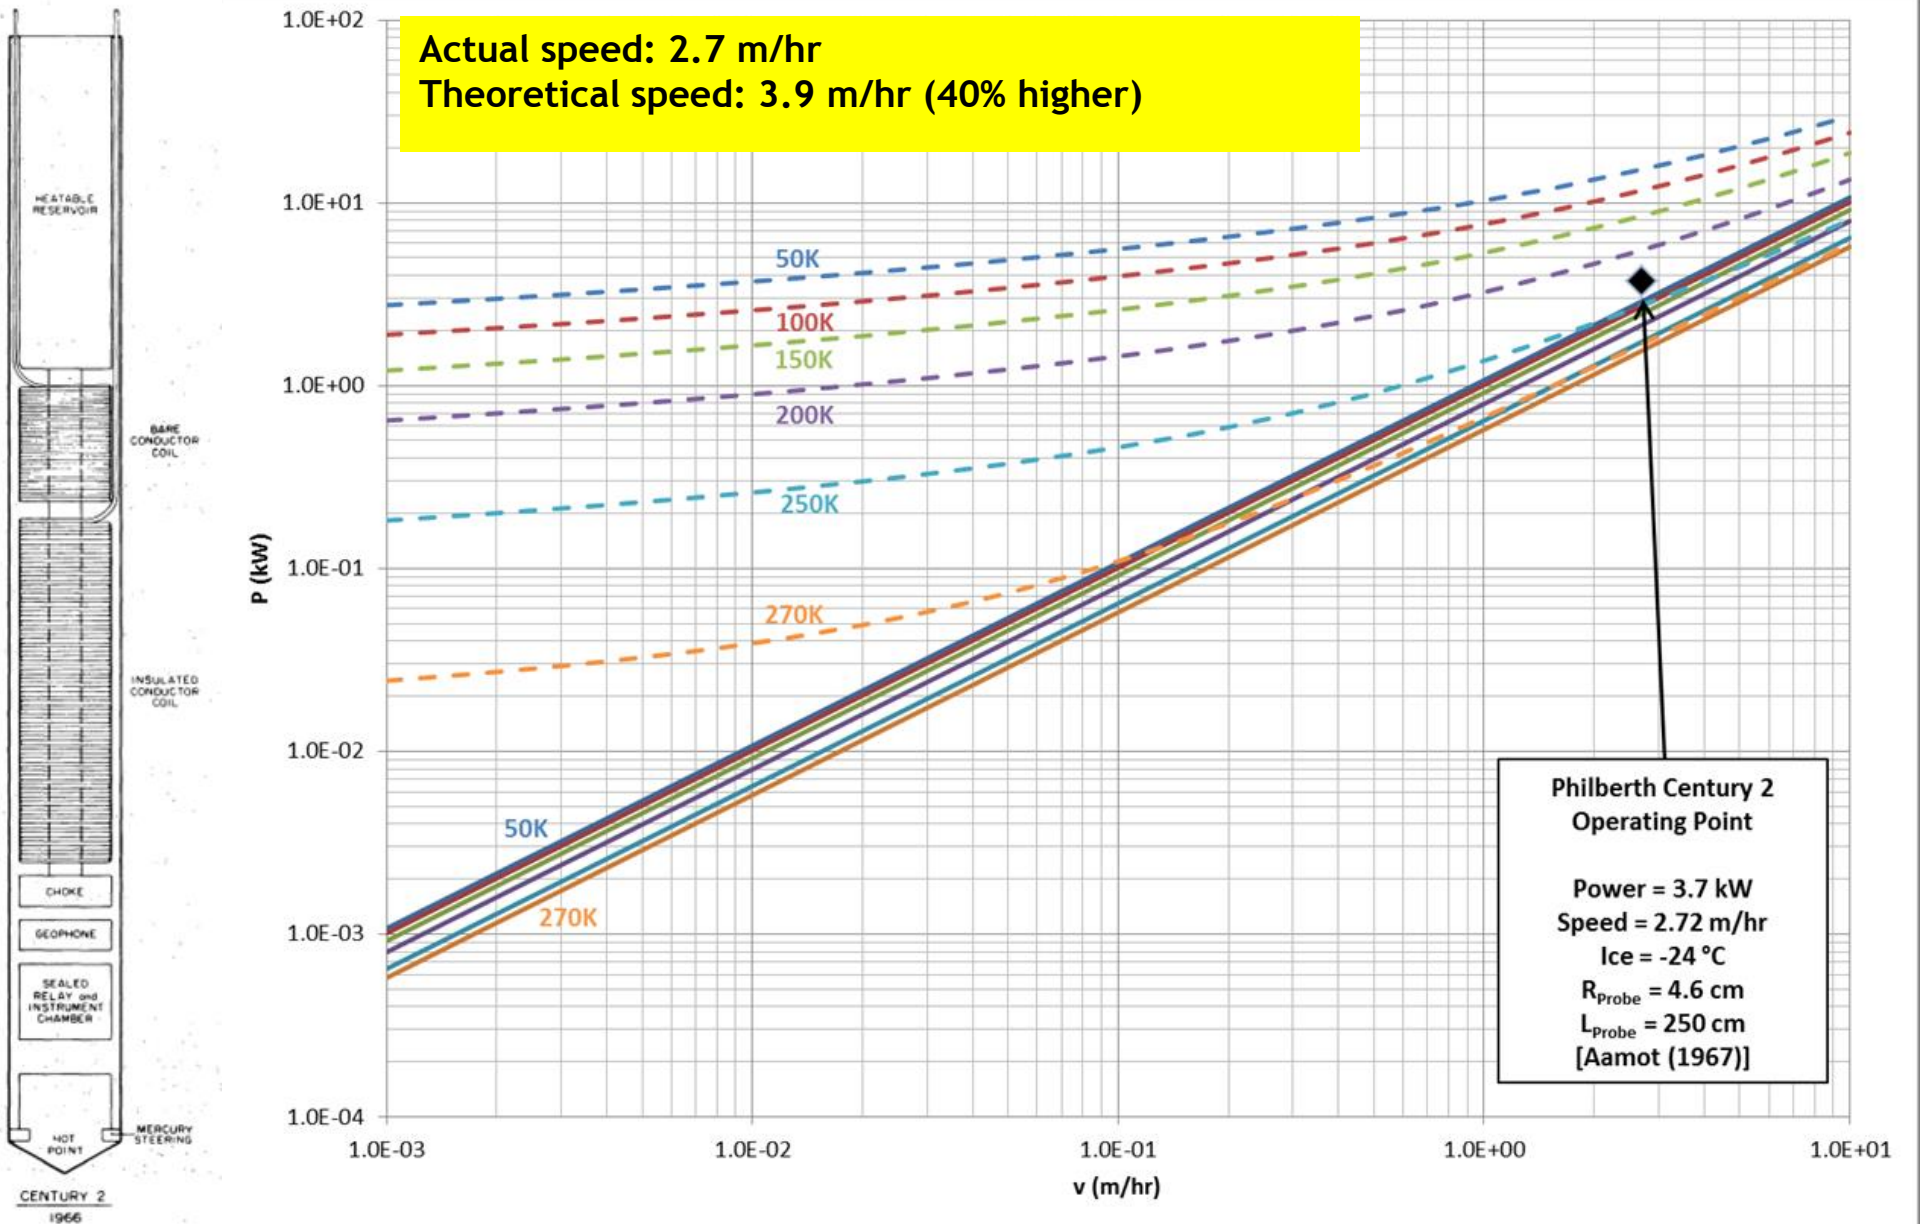

(c)

(d)

Philberth Probe at Century 2

$L = 2.5 \text{ m}$, $R = 4.6 \text{ cm}$, $\text{Ice} = -24\text{C}$, $P = 3.7 \text{ kW}$

Inchworm/Wireline/Cable Suspended

Conventional Approach

Wireline Approach

Pulley

Umbilical

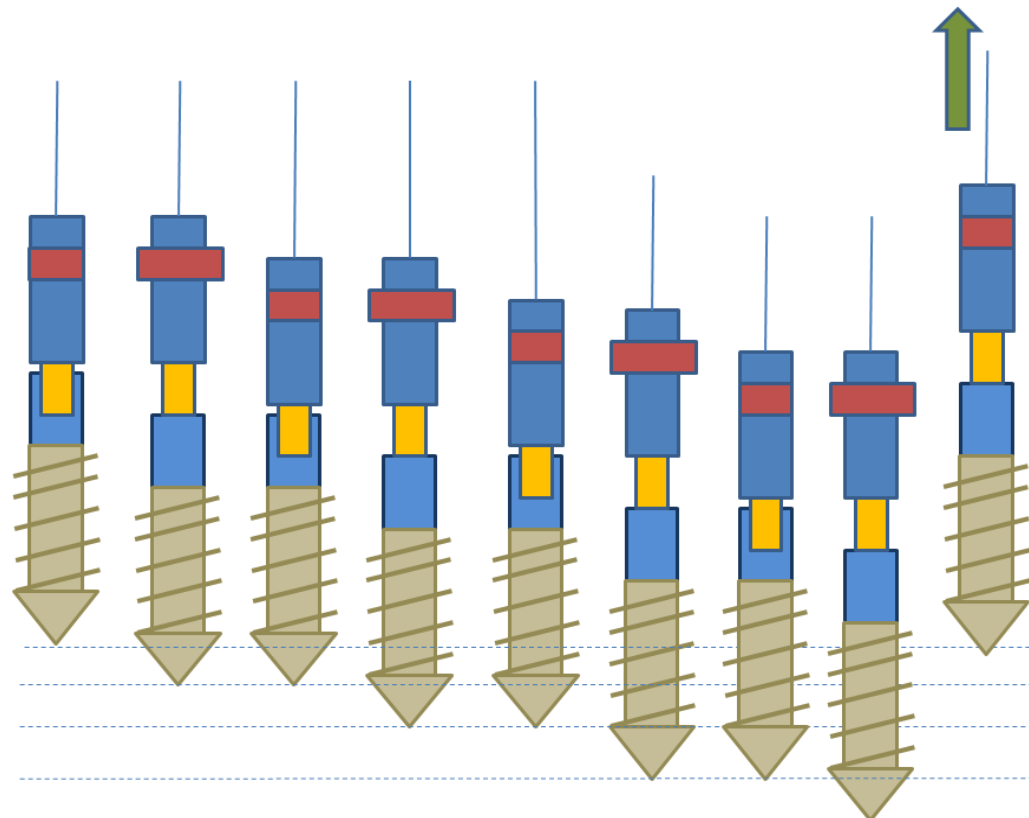

Anchor

Z-stage

Motors

Auger

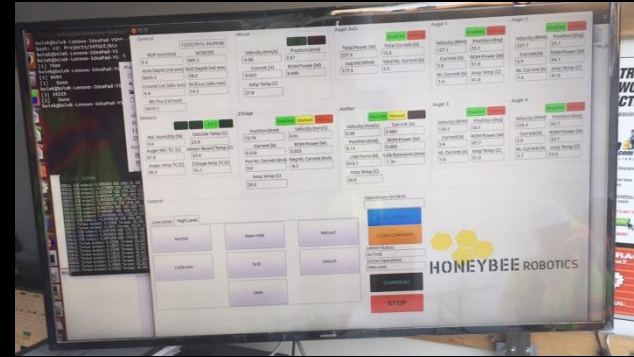

- Used in Antarctica and Greenland
- Works only when borehole is stable
 - Would need expandable casing and bi-center bit to deal with a hole collapse
- Delivers sample and can deploy instrument downhole

AMNH/AutoGopher Drill

Drill Controller

Microscope

Anchor

Z-stage

Hammer

Electronics

Auger and Bit

Microscope 0.5 micron / pixel

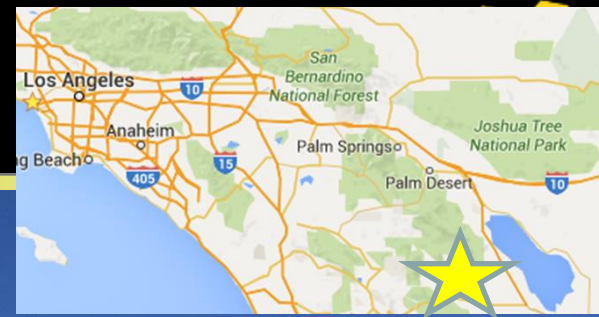

UV LED

White LED

AMNH/AutoGopher Drill

Drilled two holes

- 10.5 m
- 13.5 m

Next step: AutoGopher2,

SBIR project
with Pablo
Sobron

Instrumented Bit for In-Situ Spectroscopy (IBISS)

STTR project
with Pablo
Sobron

- LIBS and Raman*
- Deployed inside a drill

- Raman can be used as a temperature probe for ice (Sobron and Wang, JRS 2011)
- Raman can observe salts (including halides) in ice in near real time (Sobron et al, LPSC 2013)
- Raman can measure ice crystallinity (Rull et al, SAA 2011)
- Raman is sensitive to I_h, II, III, IX, V, and VI forms of ice (Sukarova et al, J. Phys. C: Solid State Phys, 1984)

Electrical Conductivity

- Ways to determine icy-soil thawing and prevent thaw-refreeze conditions.
- Critical in 'salty' and clay rich formations
- Look for a large $\Delta R / \Delta T$
 - $\Delta R / \Delta T = 700 \text{ k}\Omega / ^\circ\text{C}$ vs. $75 \text{ k}\Omega / ^\circ\text{C}$

Seismic Systems

Rover based

Drill based

Extreme Access Systems

Axel Rover

- “Axel” detaches from a rover
- Payload bay used for sampling systems and instruments
- Powder and Coring drills are at TRL 4

Zacny et al., (2013)

Drone with Samplers

Soil Sampler

Corer

Conclusions

- So far we penetrated mm's to cm's on Mars
- Current Technology Readiness Level (TRL)
 - 1 m class systems are at TRL 6
 - 10 m class systems are at TRL 4
 - 100 m class systems are at TRL 4
 - Extreme access systems should also be considered
- Drills can bring sample to an instrument and can bring an instrument to a sample. Drill integrated instruments include:
 - Temperature profile and k, (heat flow probe)
 - Seismic
 - LIBS, UV, Raman
 - Microscope
 - Strength/density (comes “free” from drill telemetry)
- PP! – we are going to the “Mars Special Regions” (Cat IVc)
