

# Planetary environments where non-aqueous liquids may be present

C. Sotin, JPL-Caltech

# Planetary environments where non-aqueous liquids may be present

Is there life where there is water? The 'follow the water' model

Paradigm change: 'Don't follow (just) the water: Does life occur in non-aqueous media?'

Introduction

(P,T) conditions for liquids to be stable

What liquids ?

What (exo) planets or satellites ?

Conclusion

# **H<sub>2</sub>O on Earth**

**Oceans :**  $1.35 \cdot 10^{21} \text{ kg}$

**Ice :**  $2.5 \cdot 10^{19} \text{ kg}$

**Underground water :**  
around  $0.25 \cdot 10^{21} \text{ kg}$

**H<sub>2</sub>O in the mantle :**  
 $0.05\% * 4 \cdot 10^{24} \text{ kg} = 2 \cdot 10^{21} \text{ kg}$

**H<sub>2</sub>O is about**  $2.5 \text{ to } 5 \cdot 10^{-4} M_T$

One issue is whether water comes from comets or from outgassing (volcanism)

# Examples of water worlds

# CH<sub>4</sub> on Titan

# H<sub>2</sub>O on Earth

# **CH<sub>4</sub> on Titan**

**Atmosphere :                      1.9 10<sup>17</sup> kg**

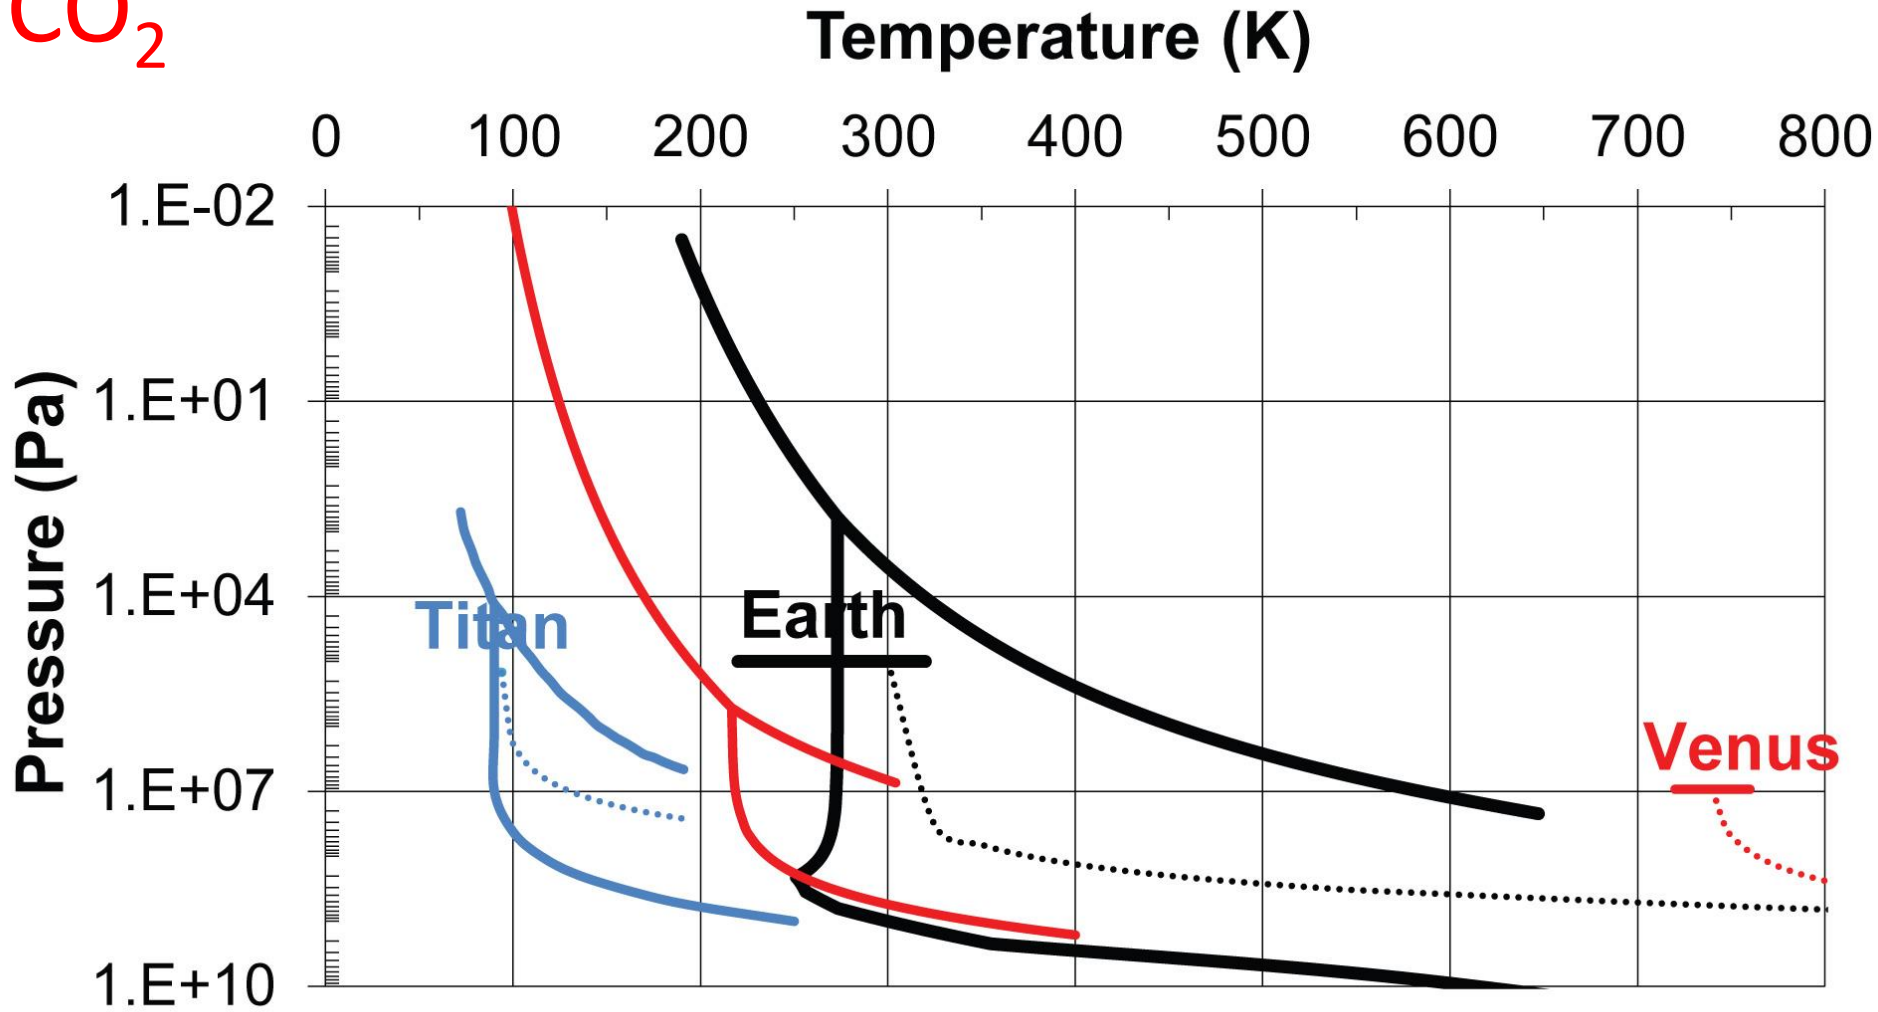

**Seas:                                2.5 10<sup>16</sup> kg**

**Underground methane :        ??**

**Methane is at least 2x10<sup>-6</sup> M<sub>Titan</sub>**

CO<sub>2</sub>

Triple point is at low temperature and high pressure (5.2-bar). Venus' surface temperature is well above the critical point – However, exoplanets may have the right surface conditions

**Magma ocean  
Atmosphere**

**Volcanic  
Atmosphere**

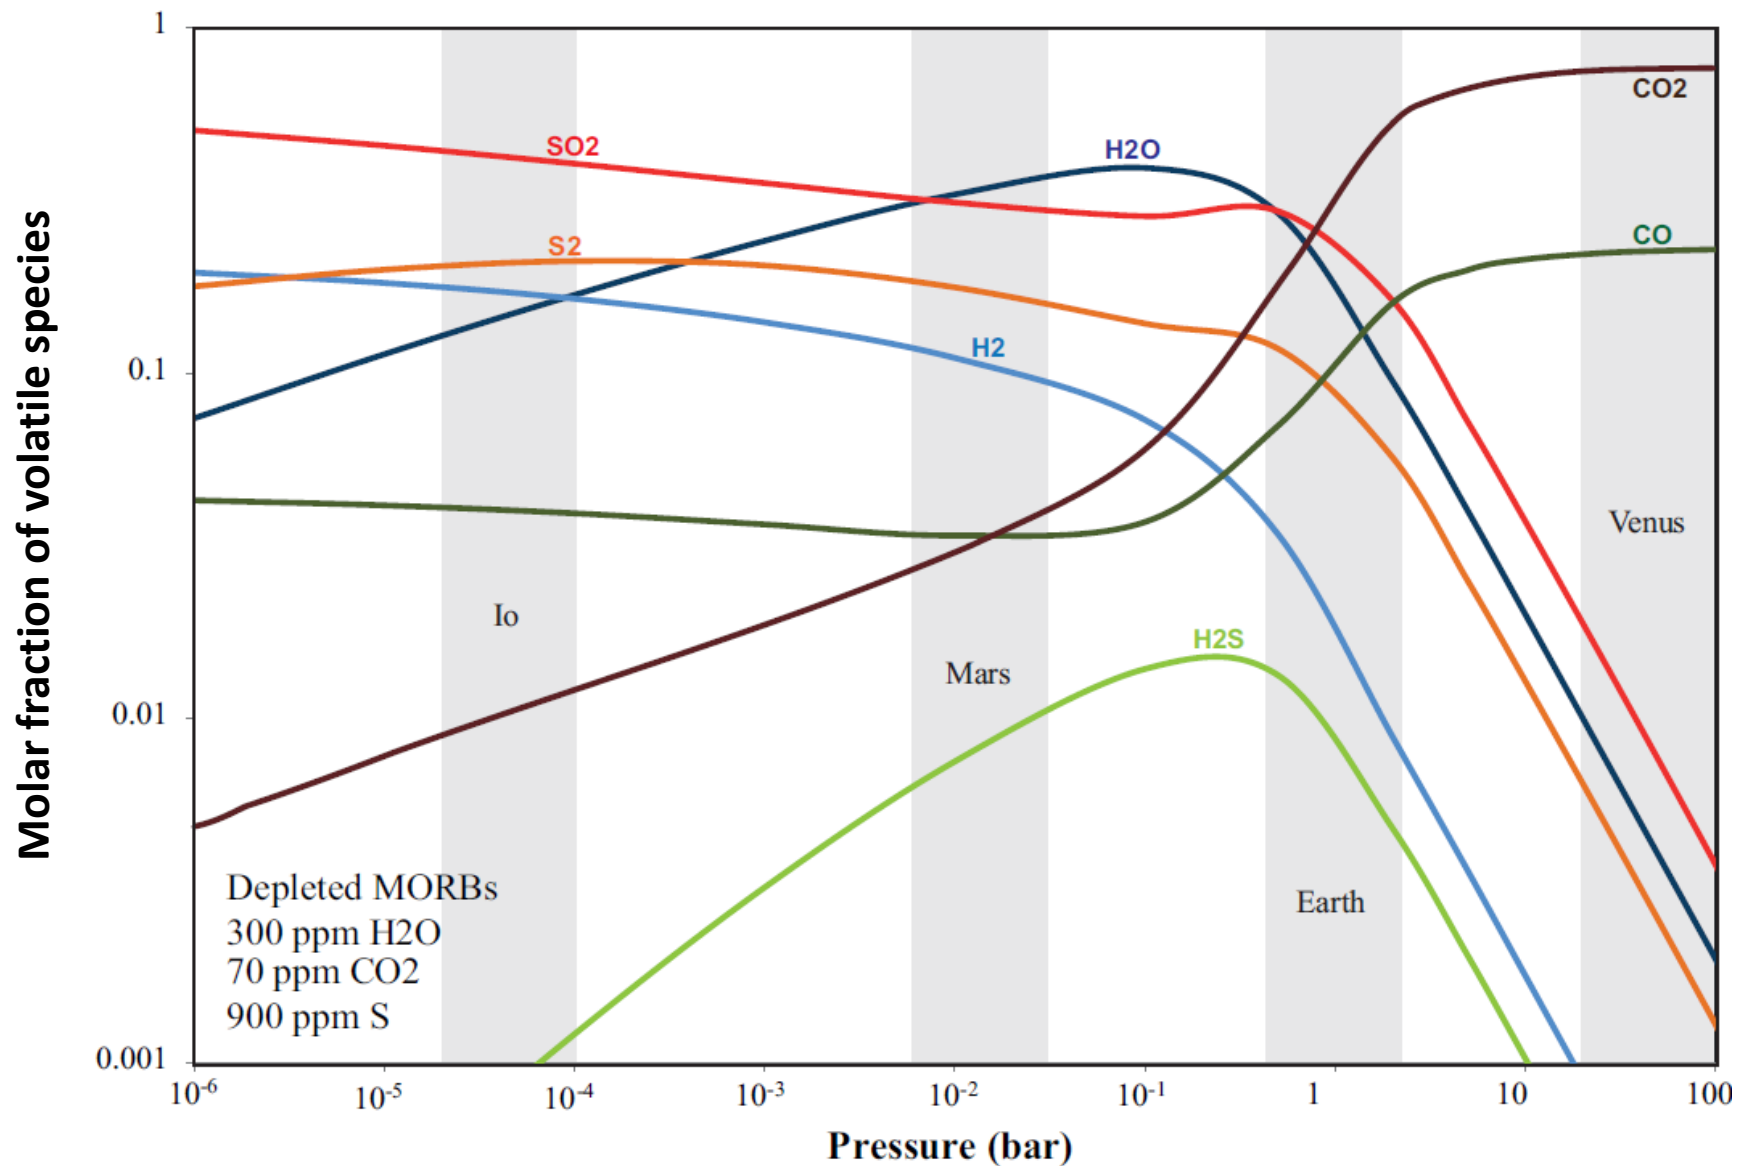

07/06/2015

Non-aqueous life

(from Gaillard and Scaillet, 2014)

The higher the pressure, the larger the fraction of CO<sub>2</sub> in the outgassing (Gaillard and Scaillet, 2014, A theoretical framework for volcanic degassing chemistry in a comparative planetology perspective and implications for planetary atmospheres)

	Triple point		Critical point	
	P (Pa)	T (K)	P (Pa)	T (K)
CH <sub>4</sub>	11,700	90.7	4,600,000	190.6
H <sub>2</sub> O	612	273.2	22,064,000	647.1
CO <sub>2</sub>	517,950	216.6	7,377,298	304.1

	P (MPa)	T
Titan	0.147	92
Earth	0.1	275
Venus	9.3	723

## Other fluids – N2

# Other fluids – $\text{NH}_3$

# Planetary environments with liquids

$\text{H}_2\text{O}$

$\text{CH}_4$

$\text{CO}_2$

Other(s)

The solar system provides evidence of liquid  $\text{H}_2\text{O}$ , liquid  $\text{CH}_4$ , and supercritical  $\text{CO}_2$ .

Other planetary systems may harbor planets with other liquids such as  $\text{CO}_2$ ,  $\text{N}_2$ ,  $\text{NH}_3$

# Summary and Conclusions

1. Liquids are confined in a small (P,T) range.
2. Although the case for H<sub>2</sub>O is well documented on Earth, the origin (fraction from cometary impacts/outgassing) is still debated.
3. The preservation of liquid over geological timescales required for life to emerge and develop may require recycling between the interior and the surface.
4. Solar system exploration has revealed the presence of liquid H<sub>2</sub>O, liquid hydrocarbons, and supercritical CO<sub>2</sub>.
5. Other liquids such as liquid CO<sub>2</sub>, liquid N<sub>2</sub>, and liquid NH<sub>3</sub> may exist on exoplanets.
6. The case for liquid CO<sub>2</sub> has been supported by recent laboratory experiments
