

# Single Photon Detectors –

from A to B (from Astronomy to Bio, and beyond)

*D. Prober, Yale Univ. Depts. Applied Physics and Physics  
with thanks for collaborators and Yale colleagues*

# Acknowledgements

- *Spectroscopy demo – soon*

# Outline

- Types of sensors
  - Transition Edge Sensor
  - Superconducting Tunnel Junction; MKID
  - SC Nanowire, Avalanche Photodiode
- Applications
  - X-ray – astronomy, spectroscopy
  - Near IR - Quantum Key Distribution
  - Bio fluorescence

# Why single photon?

- Weak sources; *spectroscopy*;  $E_{\text{ph}} = hf = hc/\lambda$
- Encode information, entangle
- Timing, coincidence
- Measure particle energy
- Speed is important = challenge in cold env.
- Arrays = key enabler for most future applications
  
- Energy scales     $1 \text{ eV} = 1.2 \text{ } \mu\text{m} = 250 \text{ THz}$      $T = 10^{12}$   
                           $1 \text{ meV} = 1.2 \text{ mm} = 0.25 \text{ THz}$   
(visible:  $\approx 1.6 - 3 \text{ eV}$ ;  $0.4 - 0.7 \text{ } \mu\text{m}$ )

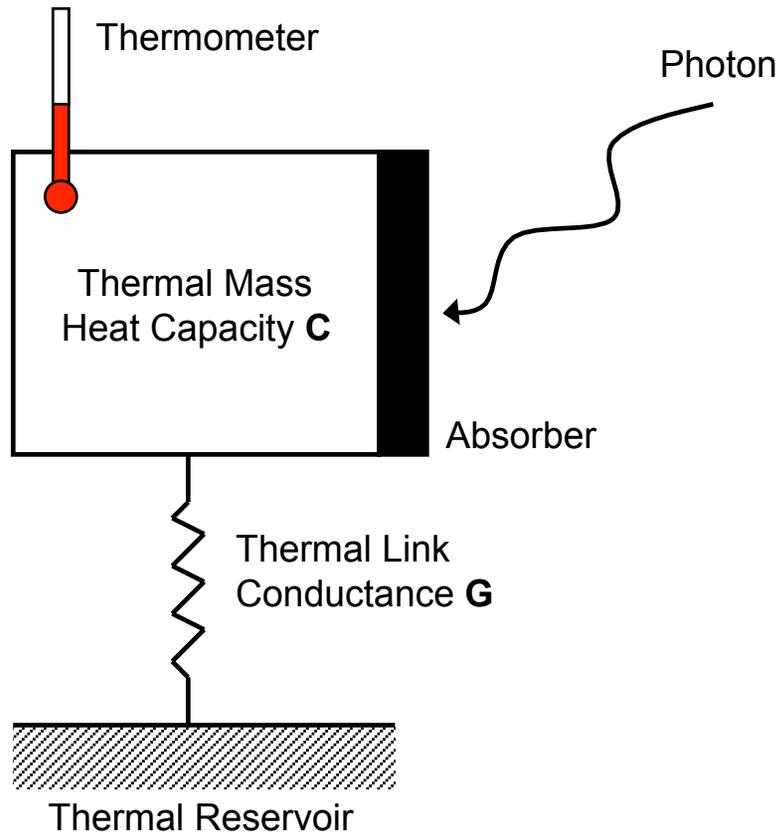

# Why single photon?

- *Spectroscopy demo – dispersive spectroscopy*

# Why single photon?

# Bolometer Detector – Thermal → cold + small

$$\Delta T = E_{\text{ph}} / C$$

Single photon

$$\tau_{\text{th}} = \frac{C}{G}$$

# Basic Transition Edge Sensor Operation

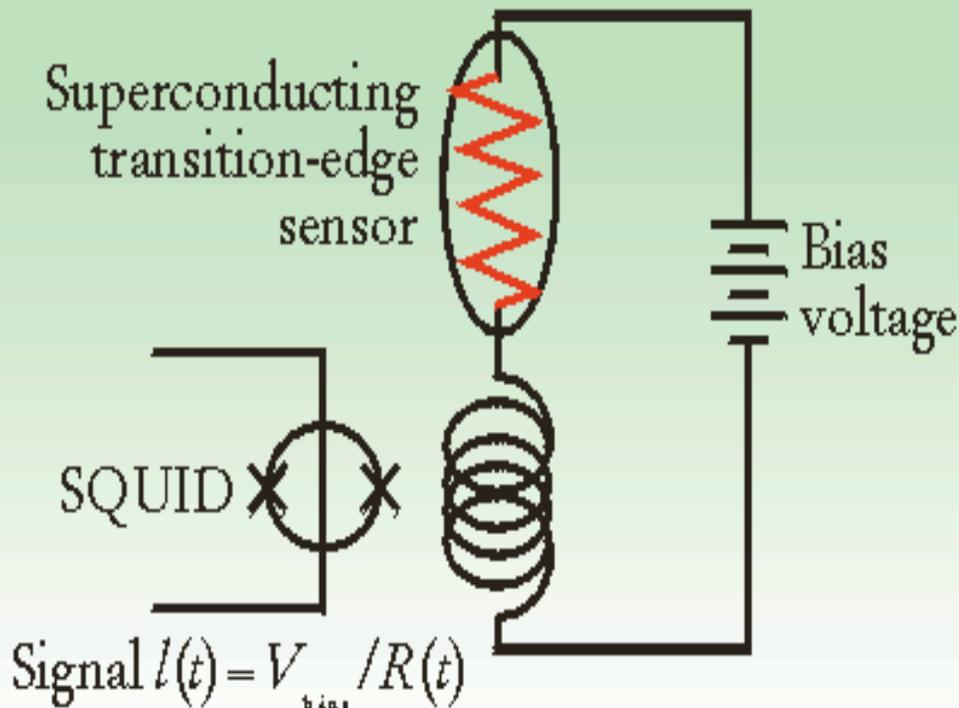

Superconducting wire (the TES) is used as a thermometer – read out changes of resistance electrically.

Typical SC transition  $T_c < 1\text{K}$

Voltage bias  $\rightarrow$  faster response, more sensitive

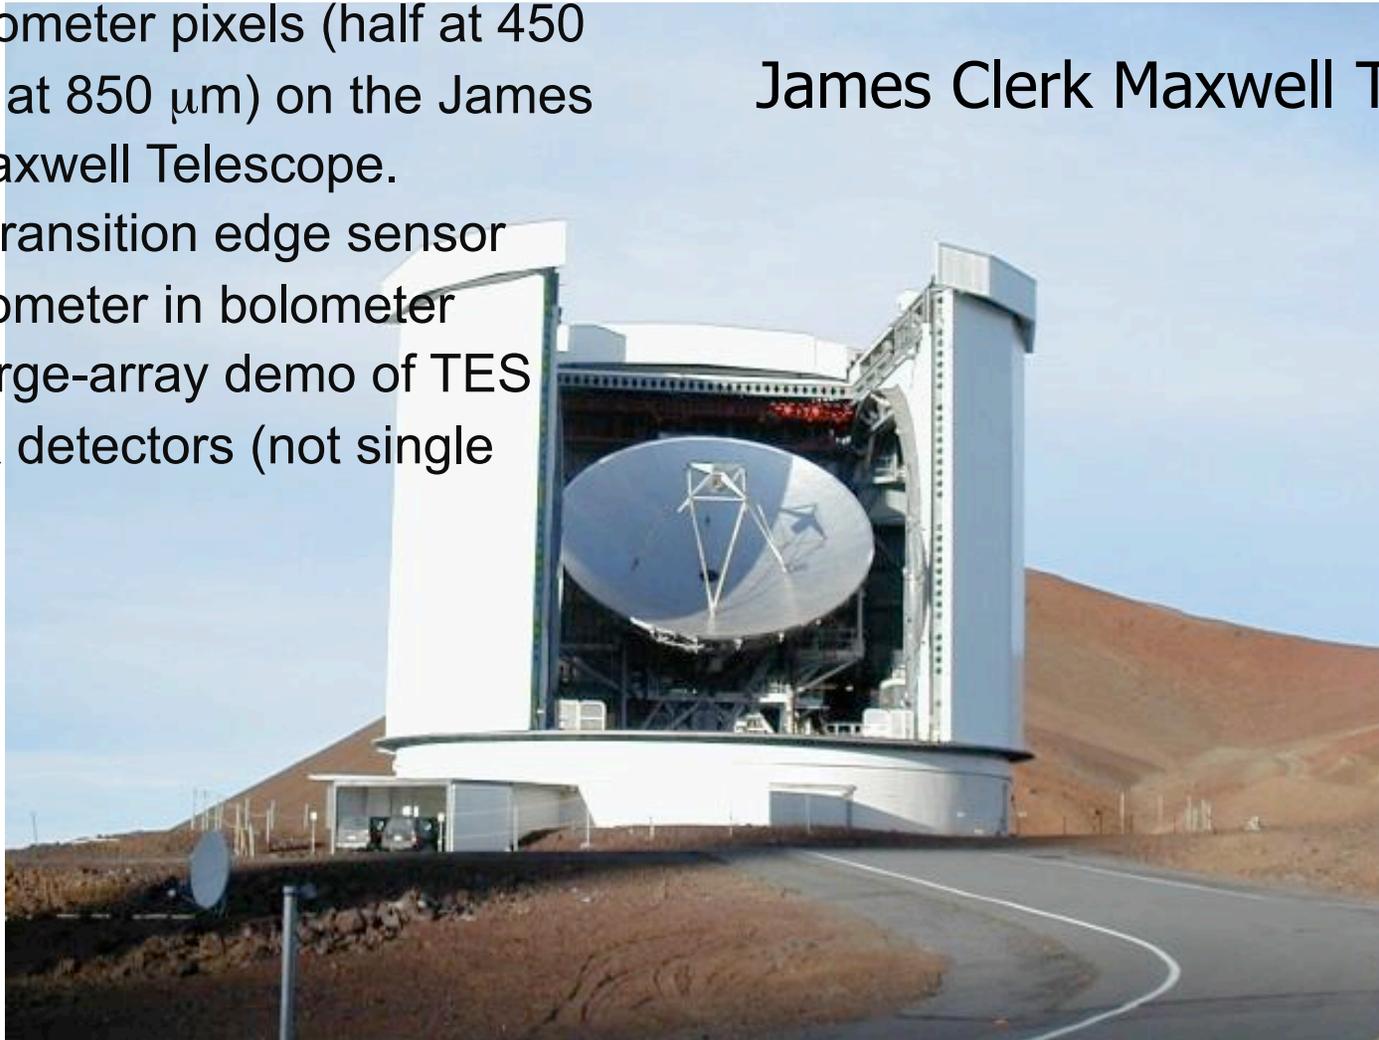

SQUIDs essential for low T multiplexing, low noise

Low count rates for astro x-ray applications  $\approx 100/\text{sec}$ ; SQUID mux 'easy'

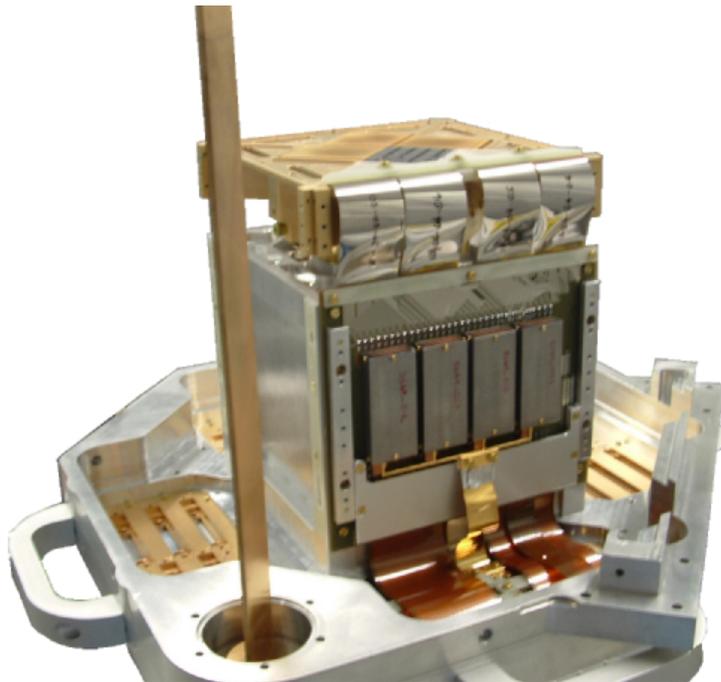

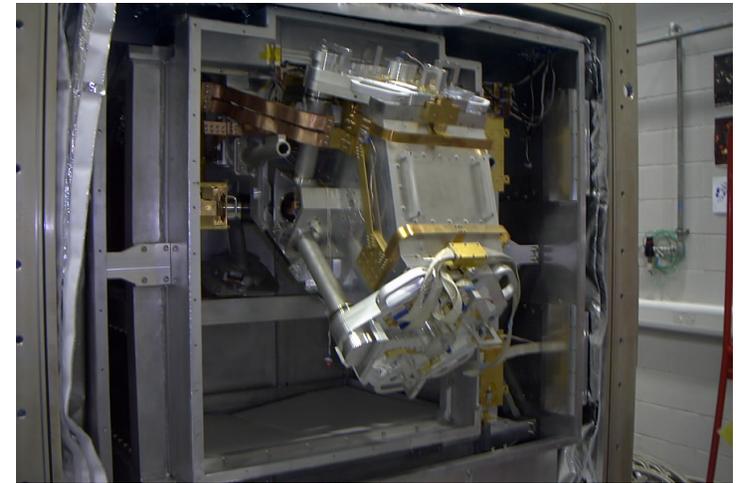

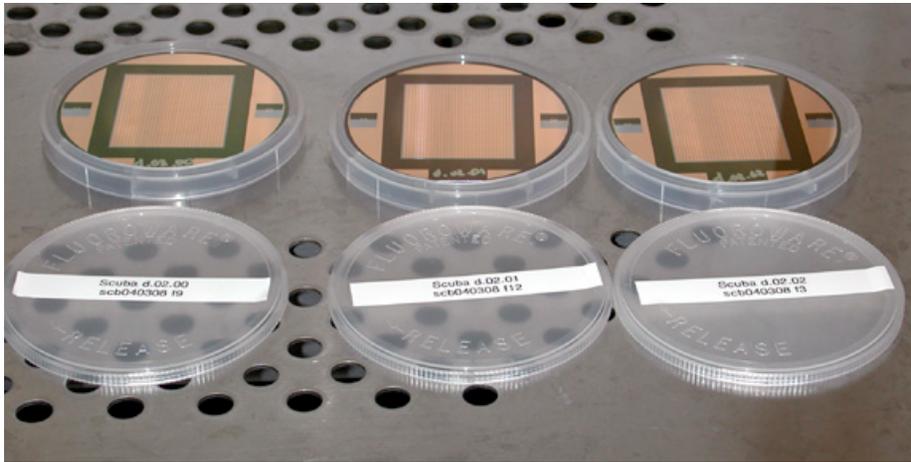

- A collaboration of the UK, Canada, Raytheon, and NIST
- SCUBA-2 will consist of 10,240 TES bolometer pixels (half at 450  $\mu\text{m}$ , half at 850  $\mu\text{m}$ ) on the James Clerk Maxwell Telescope.
- TES = transition edge sensor = thermometer in bolometer
- First large-array demo of TES POWER detectors (not single photon)

## James Clerk Maxwell Telescope

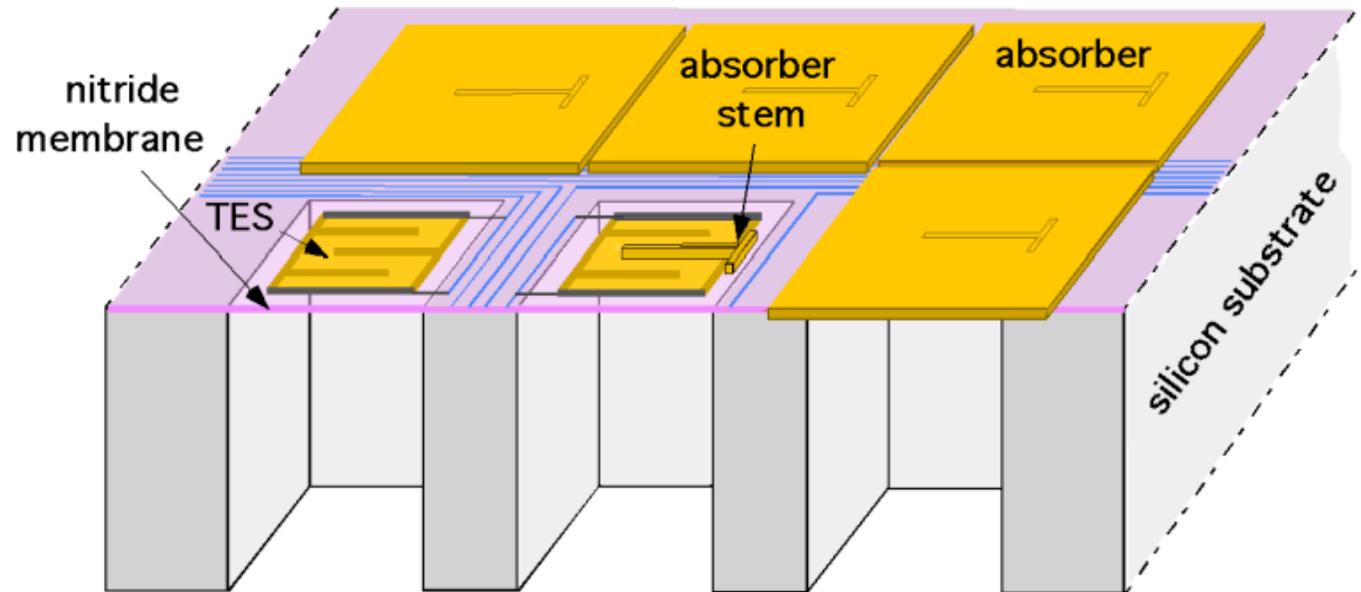

# Techniques of semicond. industry; special materials.

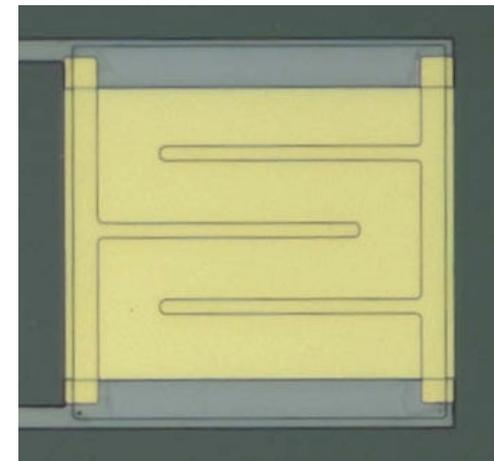

# X-Ray TES structure

Robust array construction

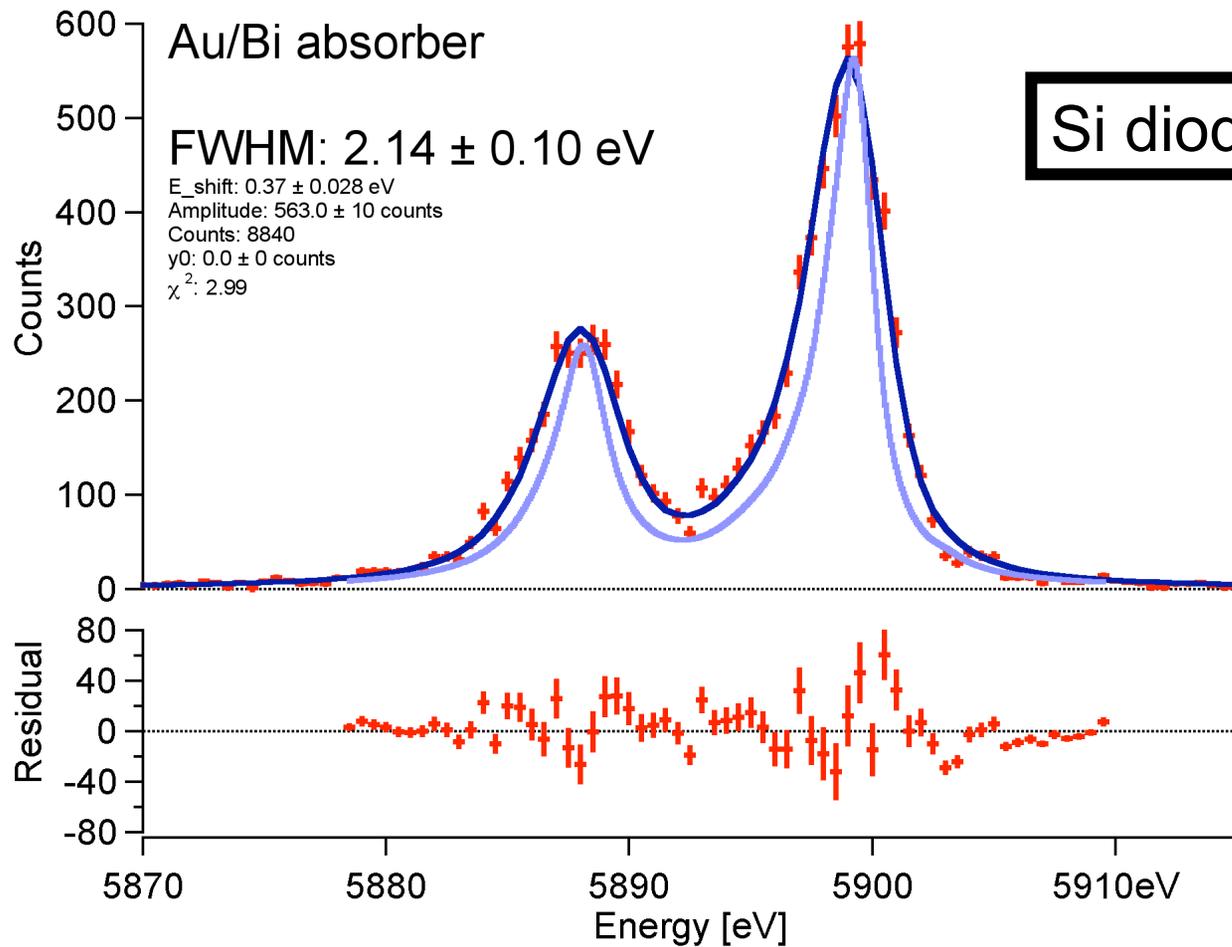

Thick Au/Bi absorber, weakly attach  
Mo/Au bilayer TES

TES is thermometer only

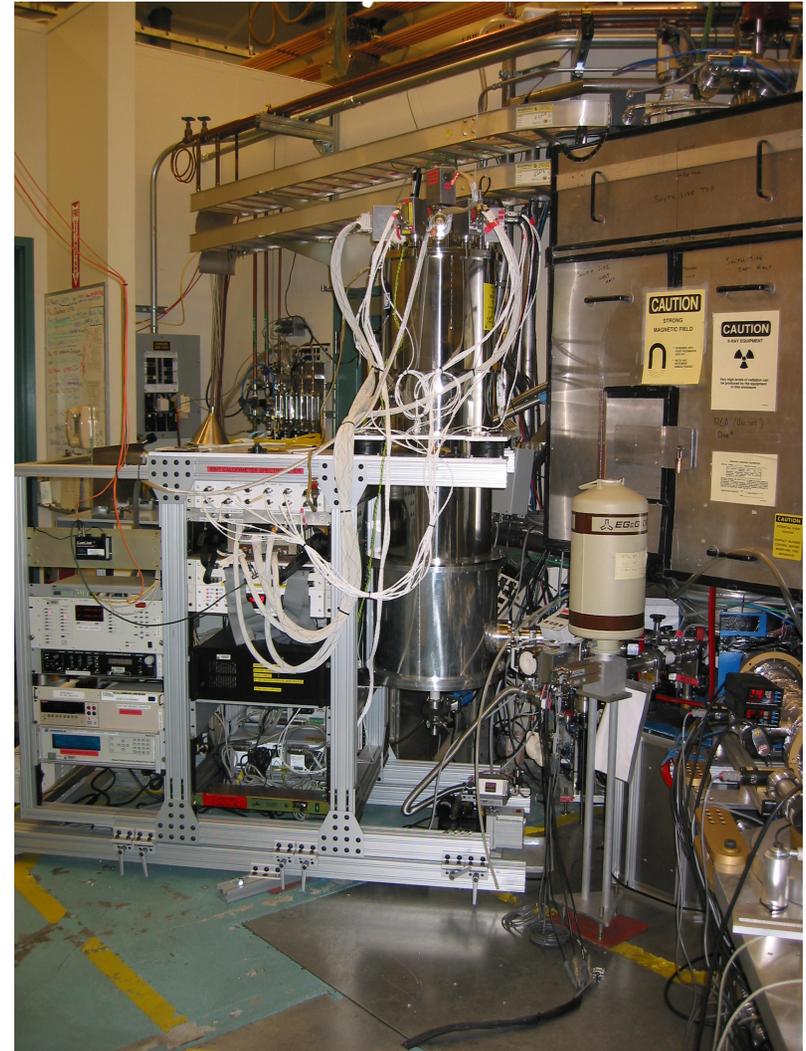

# Au/Bi Absorbers ( $\sim 1 \mu\text{m Au}$ , $4 \mu\text{m Bi}$ ) on SiN membrane; msec response

# Application to Laboratory Astrophysics

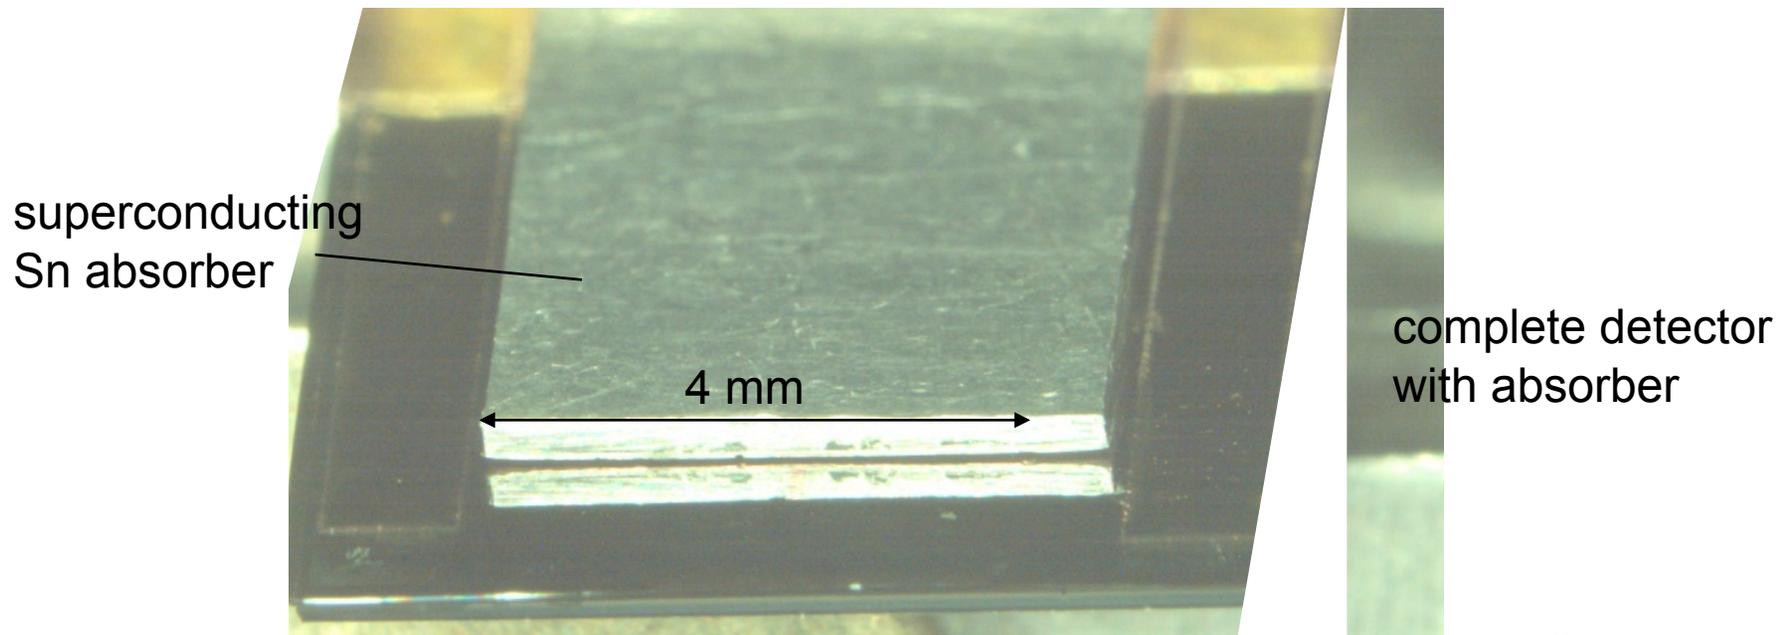

- Electron-Beam Ion Trap at LLNL
  - Astrophysically relevant plasmas in the laboratory
- Currently:
  - EBIT Calorimeter Spectrometer uses silicon thermistor array for broad-band coverage
  - Dispersive spectrometers for high energy resolution below 1 keV
- Next generation: TES spectrometer
  - Match (exceed)  $\Delta E$  of upcoming missions
  - Reduce the need for the dispersive spectrometer

EBIT Calorimeter Spectrometer at LLNL (2008)

# Microcalorimeter alpha particle detectors

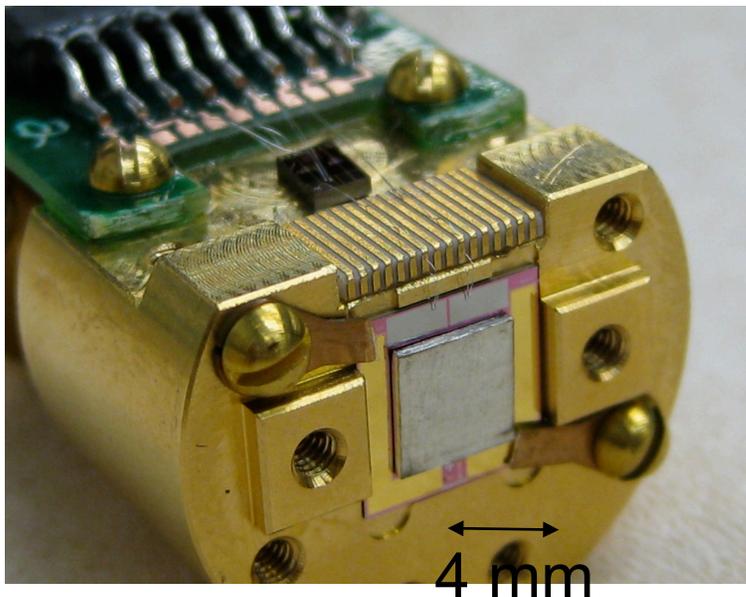

- environmental monitoring
  - nuclear safeguards
  - medical assay
- 'Scaled up x-ray TES'

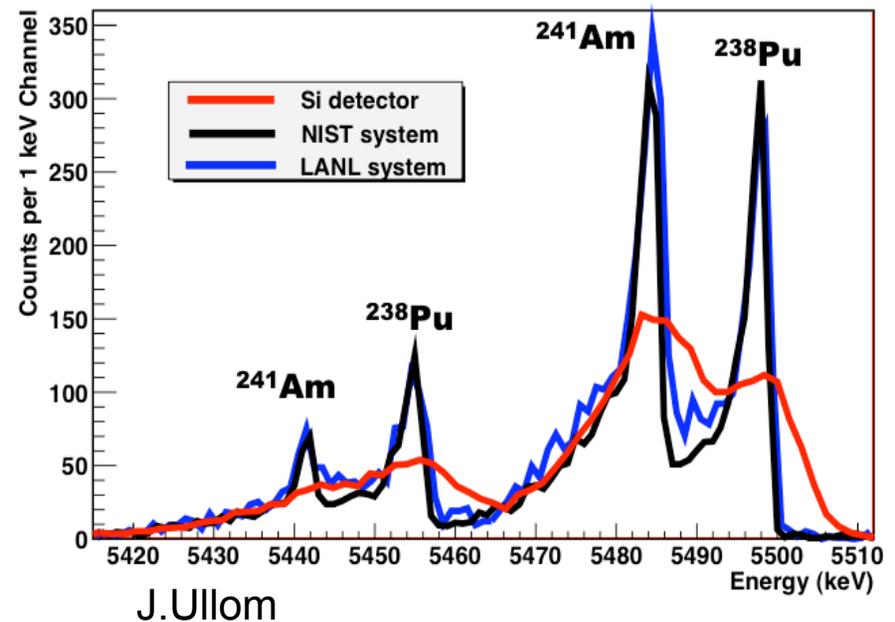

# Technology dissemination

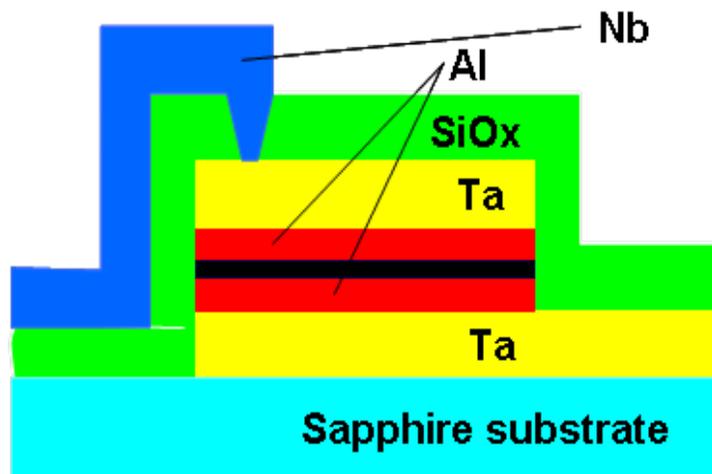

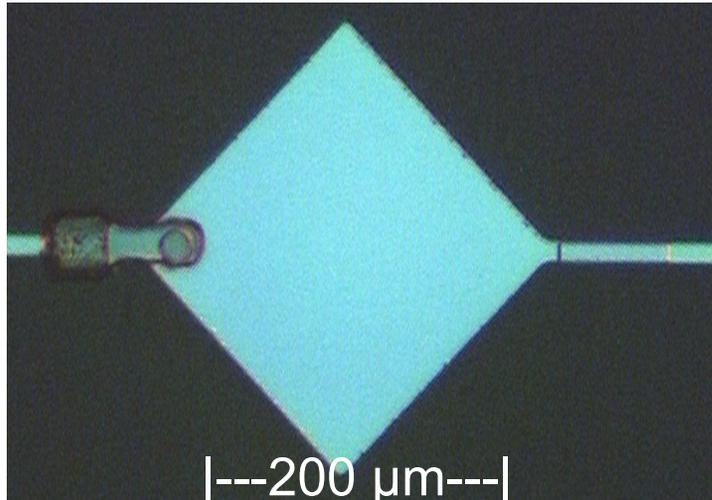

- 4 channel alpha spectrometer installed at LANL
- SQUIDs, SQUID electronics, wiring from 
- TESs originally from NIST, now from 
- High quality spectra routine
- Phase II SBIR awarded for commercial system

Mixed Actinide Spectrum Comparison

# STJ (excitation) detector

Photon breaks Cooper pairs →  
2 quasiparticles/photon initially,  
multiply by cascade until  
 $n_{\text{avg}} \approx E_{\text{ph}}/E_{\text{g}}$ ; this qp charge then  
tunnels thru oxide barrier

→ statistical variation  $\delta n \approx n_{\text{avg}}^{1/2}$   
this gives the energy resolution of  
the STJ detector

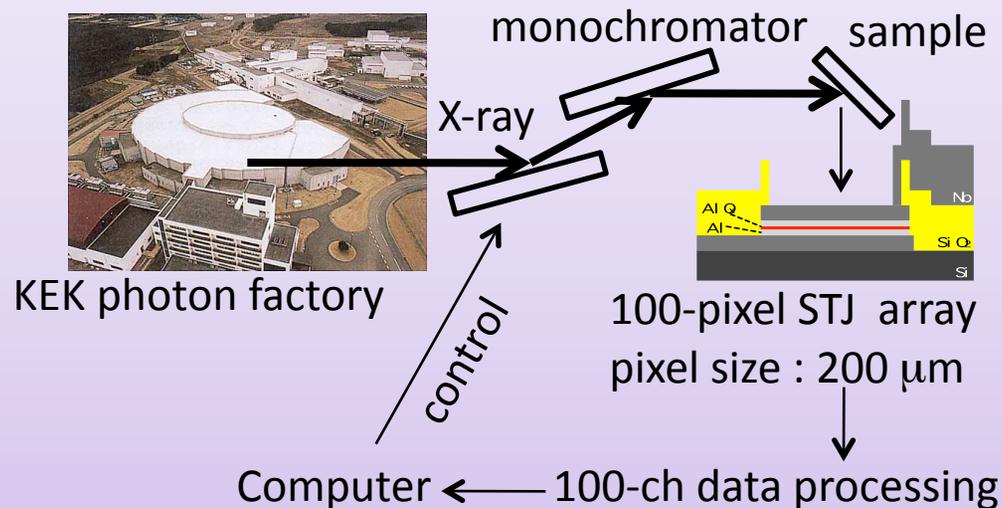

$$T \ll T_c$$

STJ – high impedance →  
semicond. amplifier

# Soft X-Ray Spectrometer Using 100-Pixel STJ Detectors for Synchrotron Radiation

## X-ray Absorption Fine Structures

Non-destructive measurement of charge states and bond length

## Advantages of STJ-XAFS

- Separation of light elements due to good energy resolution ( $< 30$  eV)
- High sensitivity in soft X-ray ( $< 1$  keV)
- Large solid angle coverage of  $10^{-2}$  sr
- Fast response,  $> 10^6$  cps @ 100-pixel
- Automated operation (Pulse tube +  $^3\text{He}$ )
- Energy resolution – fine control from monochromator, not STJ

# Beam Line use of STJs – need count rate (does not need TES energy resolution)

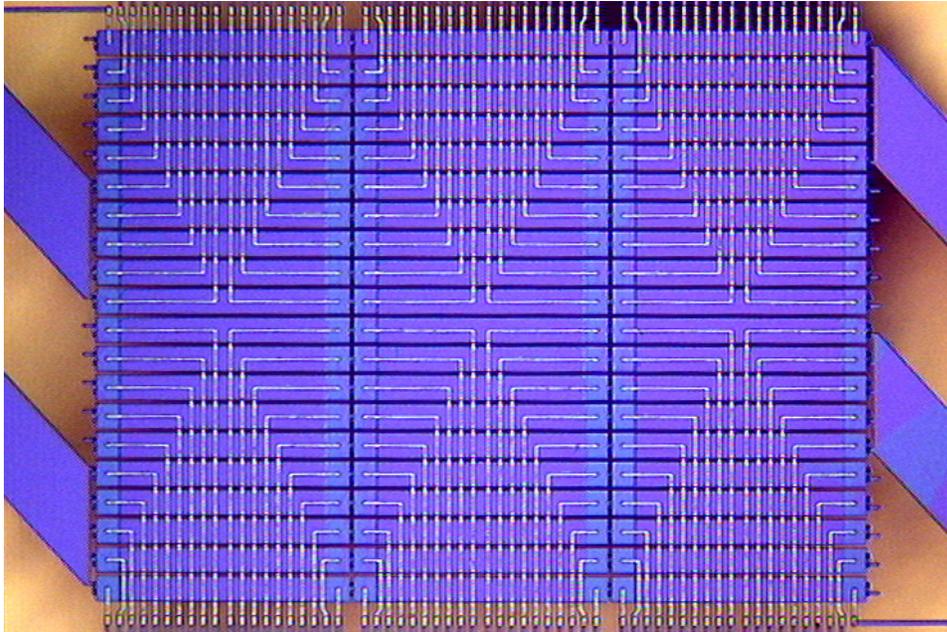

Natl. Inst. of Advanced Industrial  
Science and Technology (AIST), Japan  
0.2 – 2 keV

Stanford SSRL - 112 pixels  
LBL-ALS - 9 pixels  
– S. Friedrich, LLNL

# First Results On The Imaging Capabilities Of A DROID Array In The UV/Visible

R.A. Hijmering,  
et al., ESA LTD13

DROID =  
Distributed ReadOut  
Imaging Detector

- 3x20 DROID array  $33.5 \times 360 \mu\text{m}^2$  → 120 amplifiers
- Photons from back side
- Ta DROIDS, Ta/Al STJ; 11 'pixels' per DROID
- Measured in S-Cam3 system (single STJs)
- Offline coincident events determination
- Testing, development in progress

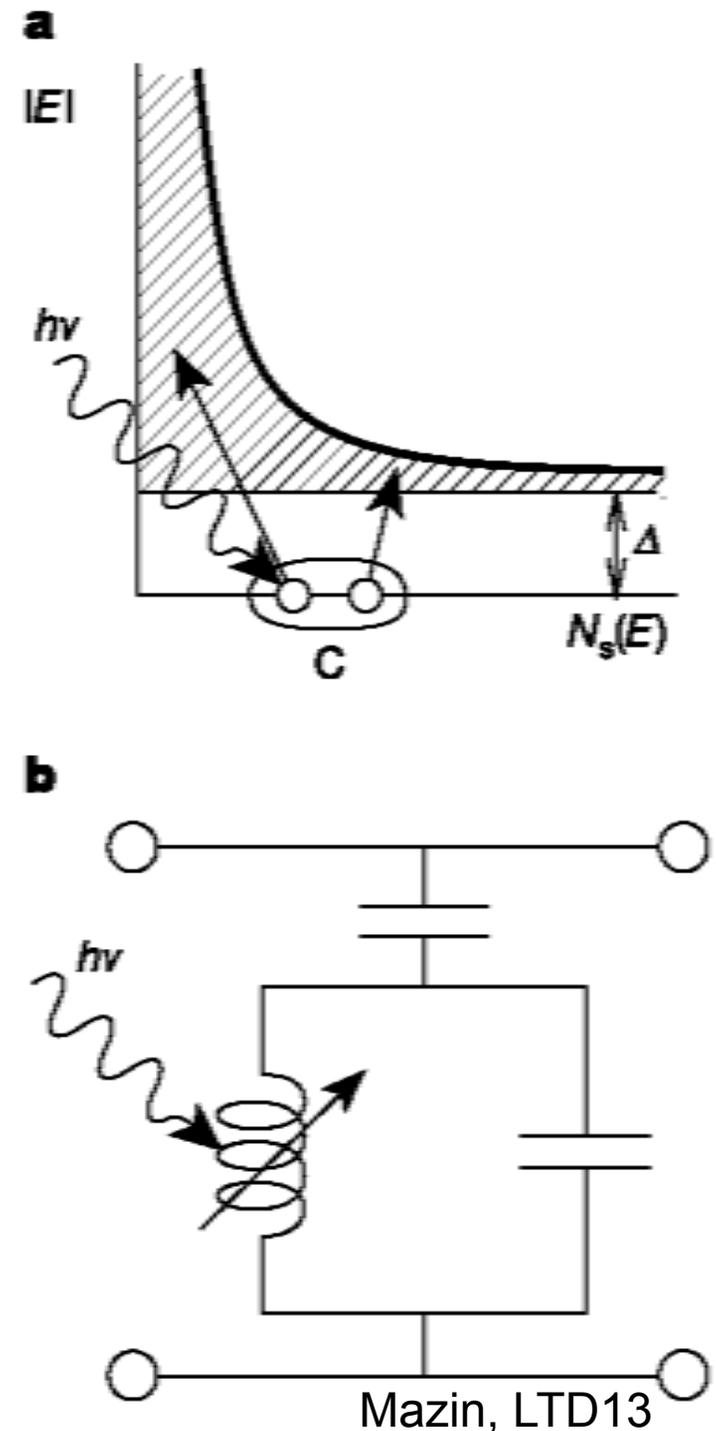

# Microwave Kinetic Inductance Detector

Absorb photon in supercond. quarter-wavelength resonator.

Inductance = magnetic + kinetic

Kinetic inductance increases and resonant freq. decreases, due to reduced number of pairs

-the hometown candidate!

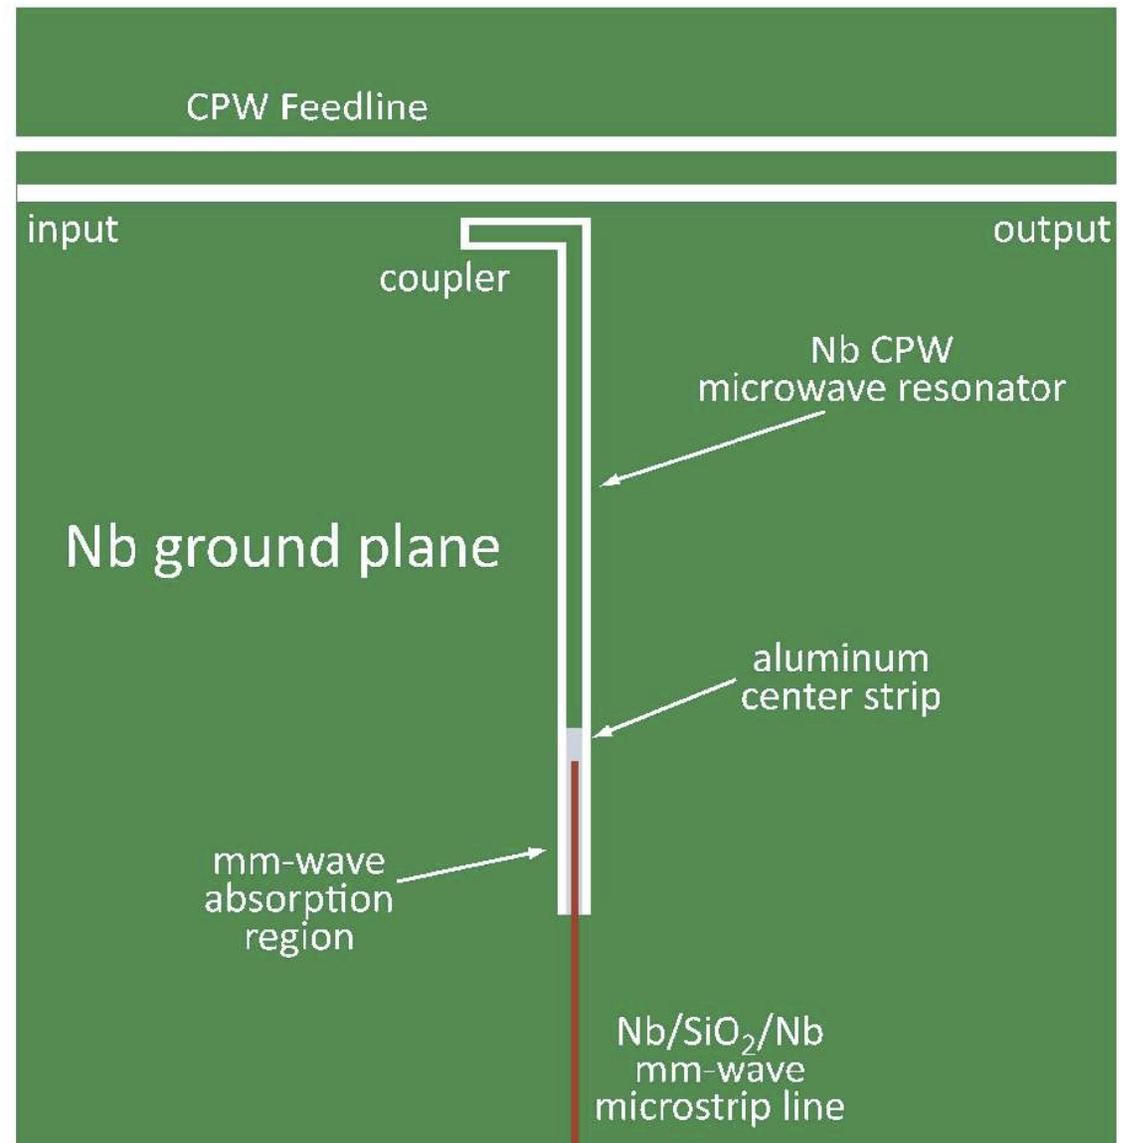

# First demo – mm-wave camera at CSO

Detects power.

Nb microstrip to couple mm-wavelength photons from antenna to a lossy Al strip; creates qps in Al.

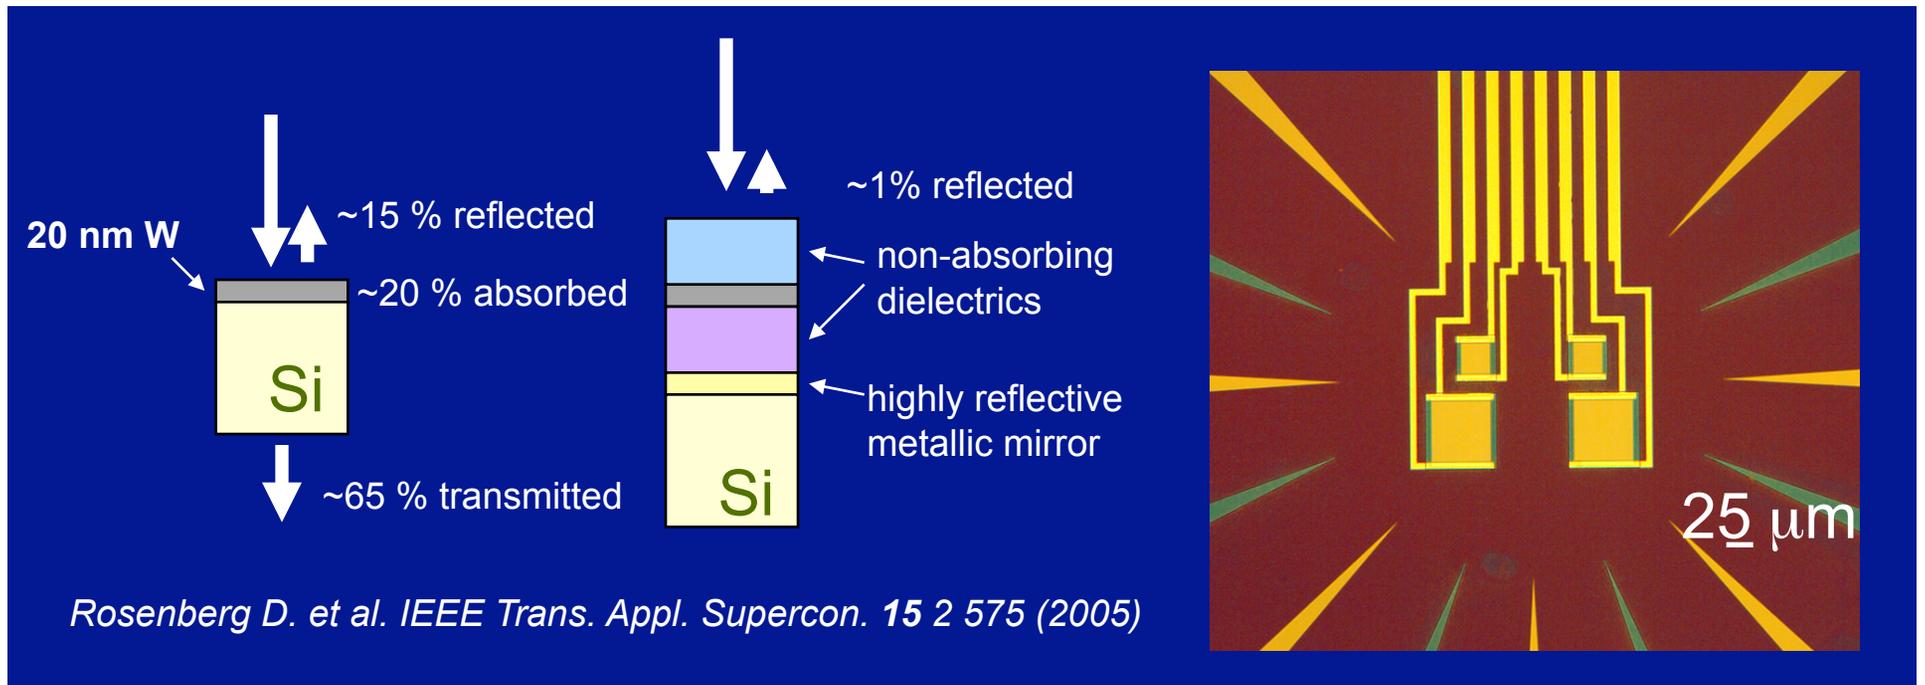

**Array concepts – strong, demonstrated; capitalizes on existing microwave digital sig. processing; open source collaboration (Ben Mazin, UCSB).**

**Collaboration in many areas of device development.**

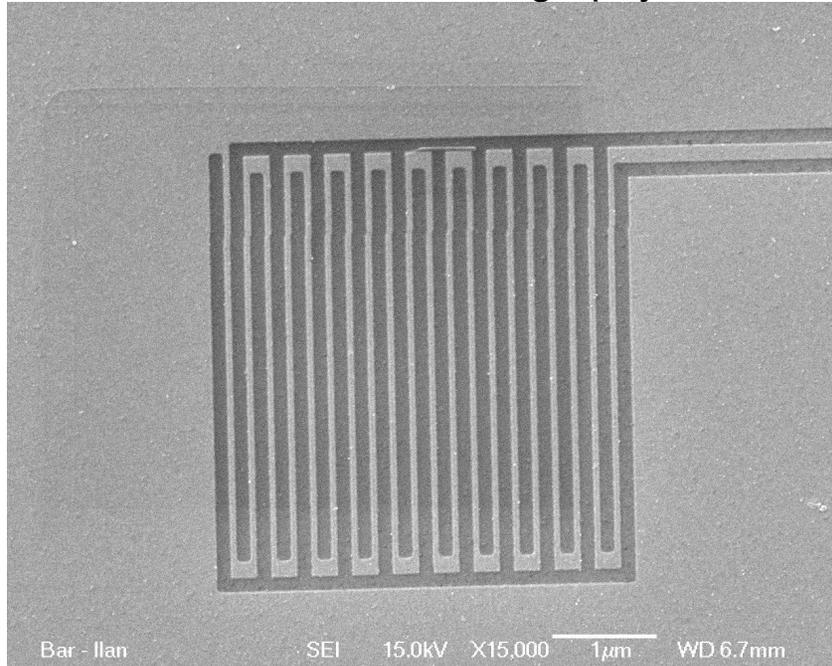

# Optical TES - Structures to Enhance Detection Efficiency for Visible/IR

- 95%  $\pm$  2% system detection efficiency for 1550 nm
- Microsecond response

# Superconducting Nanowire Single Photon Detectors

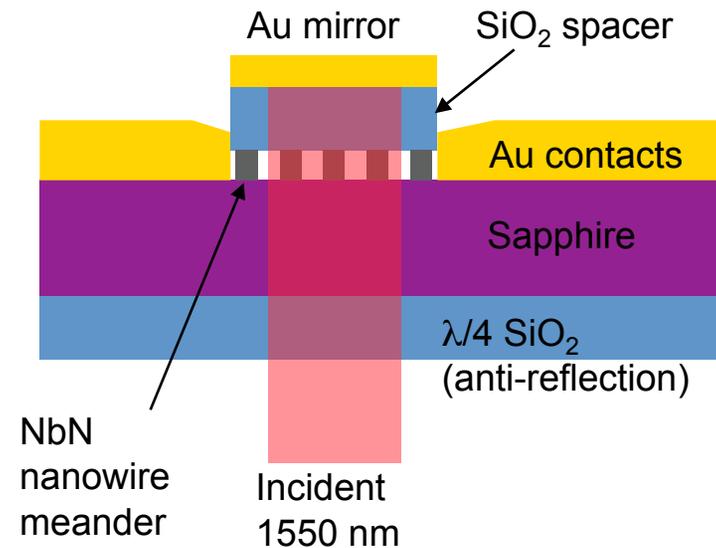

electron-beam lithography

Meander pattern - Yale Nb device;

Performance shown below for MIT/LL devices made from NbN films

electron-beam and optical lithography

Cavity structure + AR coating improves coupling to ~ 85%

K. Rosfjord, et al., Optics Express 14, P. 527 (2006).

# Detection System Performance

- **2 fibers coupled to detectors in a single cryocooler**
  - Each fiber is integrated with a long-working-distance focuser
  - Focuser is nano-positioned over the detector
  - Light is coupled into a semicircular detector
  - $< 2$  dB coupling loss
- **System detection efficiency = 31%**
- **Timing jitter  $< 40$  ps**
- **Recovery time**
  - $< 9$  ns to 50% of initial DE
  - $< 20$  ns to 90% of initial DE

**Slides from E. Dauler, Lincoln Lab**

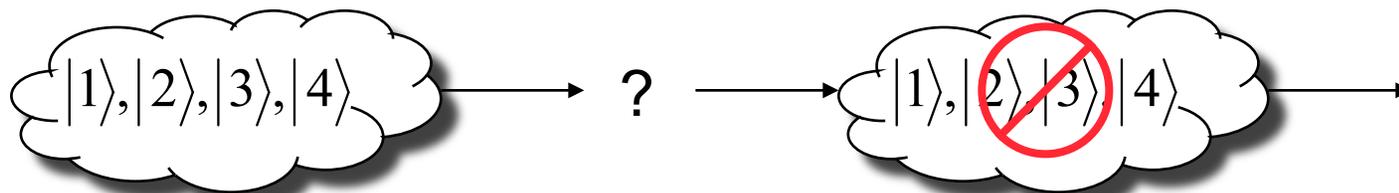

This work is sponsored by the United States Air Force under Air Force Contract #FA8721-05-C-0002. Opinions, interpretations, recommendations and conclusions are those of the authors and are not necessarily endorsed by the United States Government

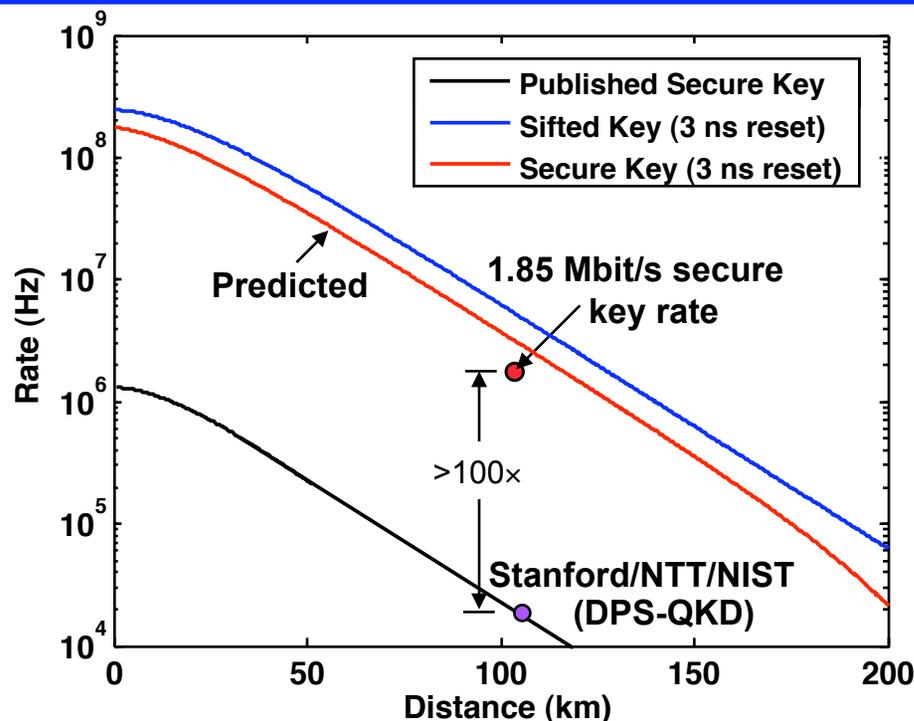

# Quantum Key Distribution QKD Basics

- **Key idea: send quantum states such that eavesdropping must affect the state in a measurable way**
- **Requirements – transmit between fiber ‘terminals’ that are up to 100 km apart; use conventional fiber networks, either 1550 nm or 1300 nm (to avoid 1550 traffic)**

# New QKD Secure Key Rate Record

- Previous record (100+km): Stanford / NTT / NIST groups demonstrated 17 kbit/s over 105 km and 10 bit/s over 200 km fiber
- New record (100+km): 1.85 Mbit/s secure key rate over 101 km of fiber
  - Utilizes higher-efficiency superconducting detectors & better DPSK technology – E. Dauler; K. Berggren talk

# NIST Fiber QKD with LANL

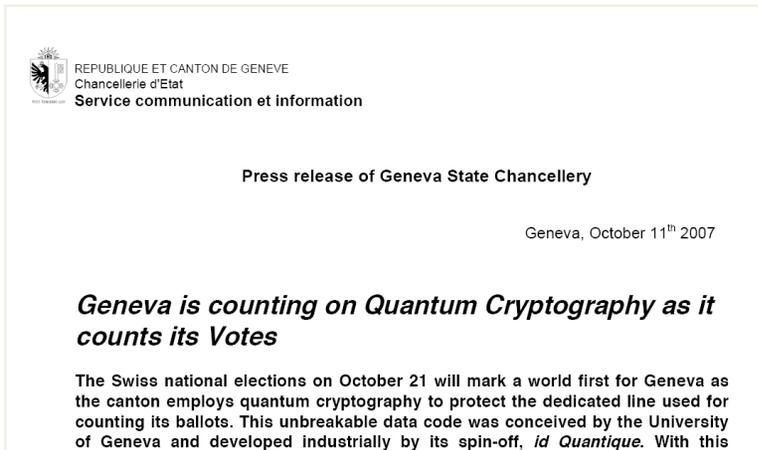

Hiskett et al , New  
J. Phys. 8 193 (2006)

Rosenberg et al, Phys.  
Rev. Lett. 98, 010503  
(2007)

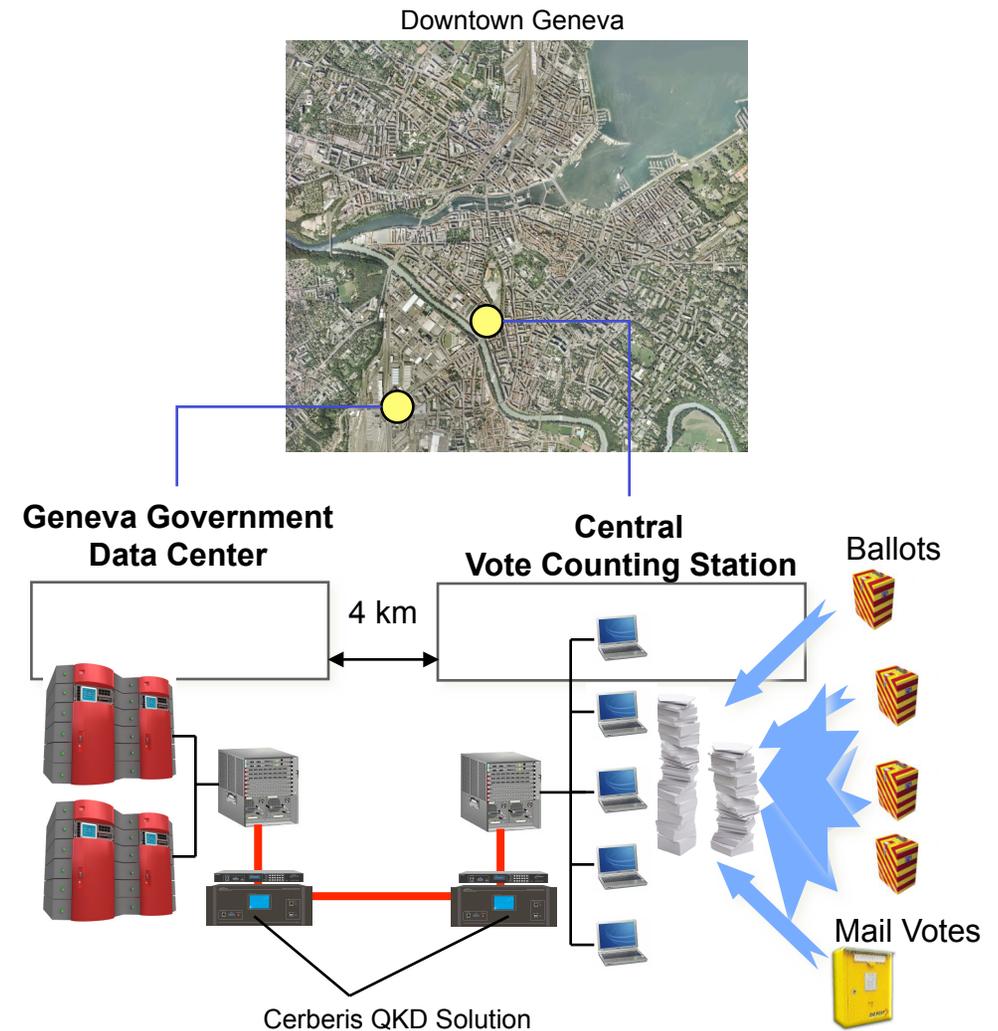

S. Nam, NIST Boulder

# QKD secures Elections in Geneva

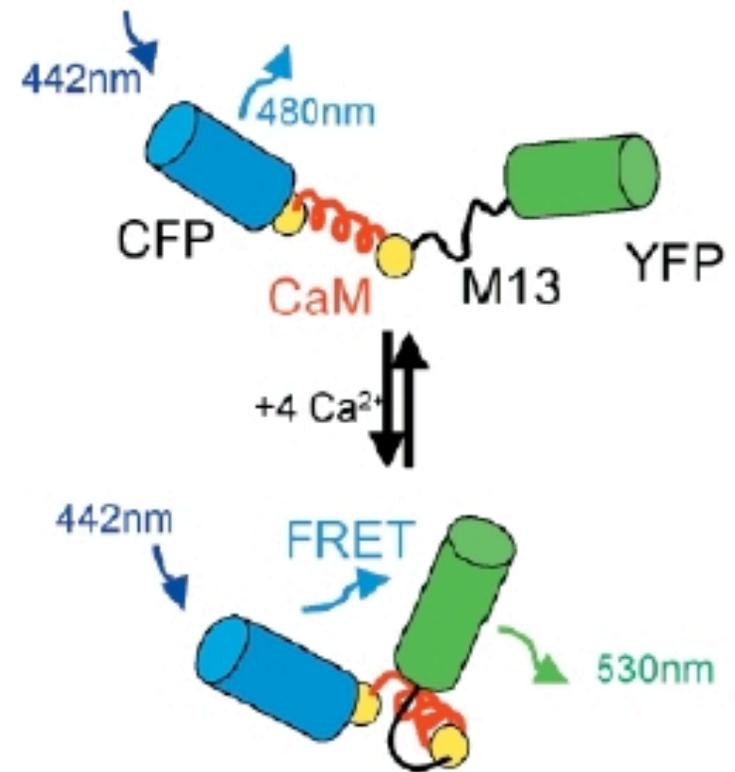

- First Deployment: September 2006 – October 2007, with election day on October 21<sup>st</sup>
  - Installation time: 30 minutes
  - Continuous operation during more than 7 weeks
  - Encryption of a Gigabit Ethernet link
- As of 2008, used to secure all elections in the Geneva Canton
  - Used in Oct. 08, Oct. 09 and Nov. 09

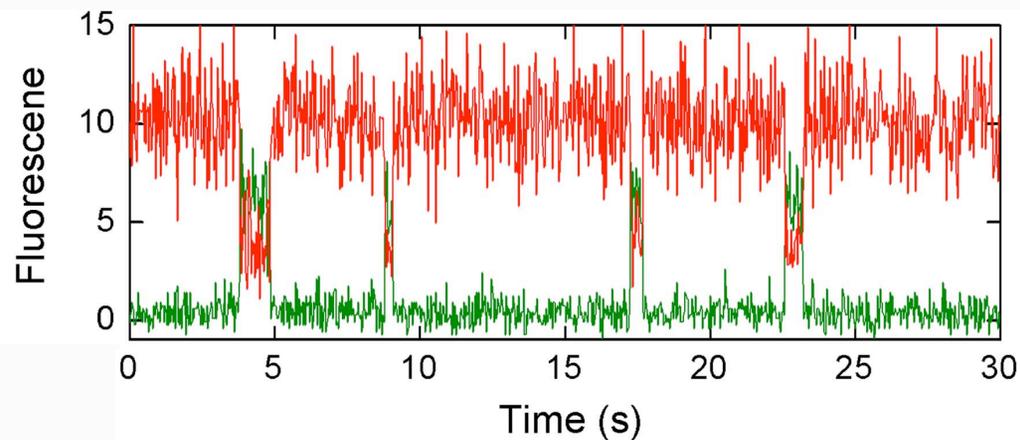

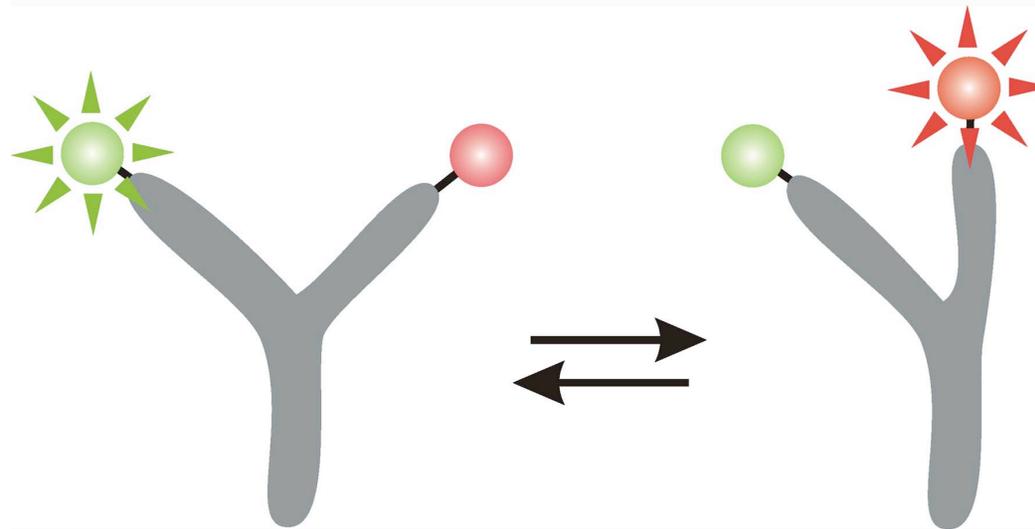

# Bio Applications – Single Molecule

- FRET – Fluorescence Resonance Energy Transfer
  - Single molecules only emit 100s to 1000s of photons (typically)
  - Want to know spectrum, timing, everything
  - Visible, NIR;  $\approx$  all commercial
  - SPAD (like photomultiplier)
- ([www.labautopedia](http://www.labautopedia))

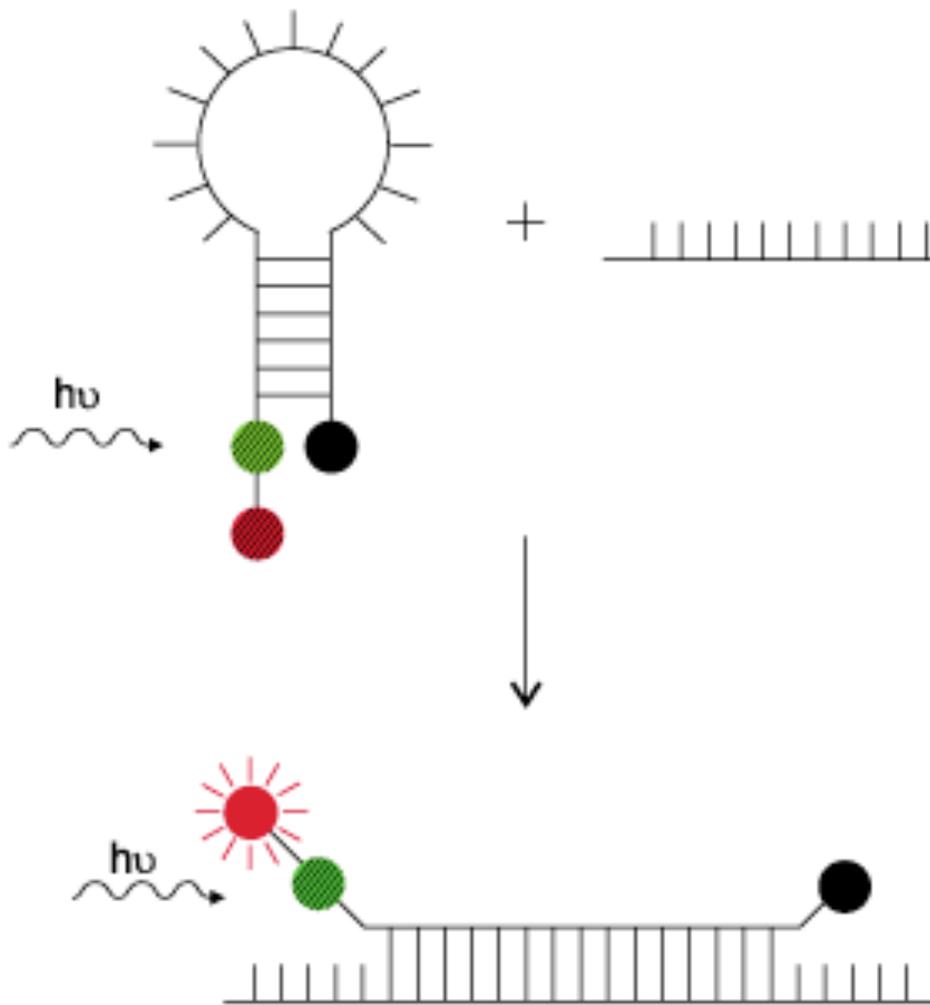

FRET = higher Ca concentration

# FRET – if binding and unbinding (measure cts/sec)

# Bio Applications – Single Molecule; binding

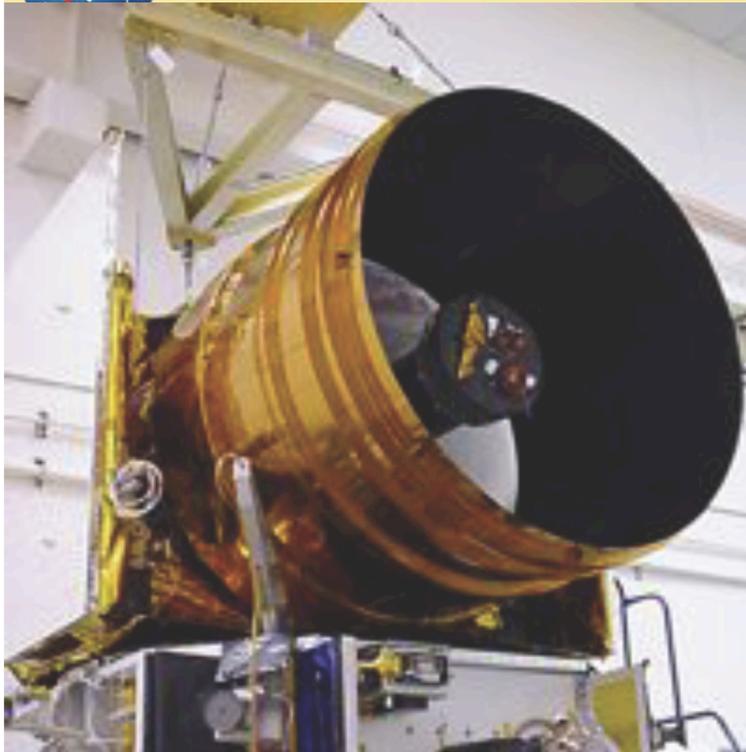

- C,T,G,A – cytosine, thymine, guanine, adenine (A--T,C--G)
- Black dot is 'quencher', green is absorber, red = fluor
- Cancer diagnostic? NIR
- Pathology during operation – less removal
- Molecules delivered by FedEx

# ICESat/GLAS - Ice, Cloud and land Elevation Satellite / Geoscience Laser Altimeter System (2003)

## ICESat1-GLAS Integration

GSFC

# FIR Single Photon Det.- Astro Motivation

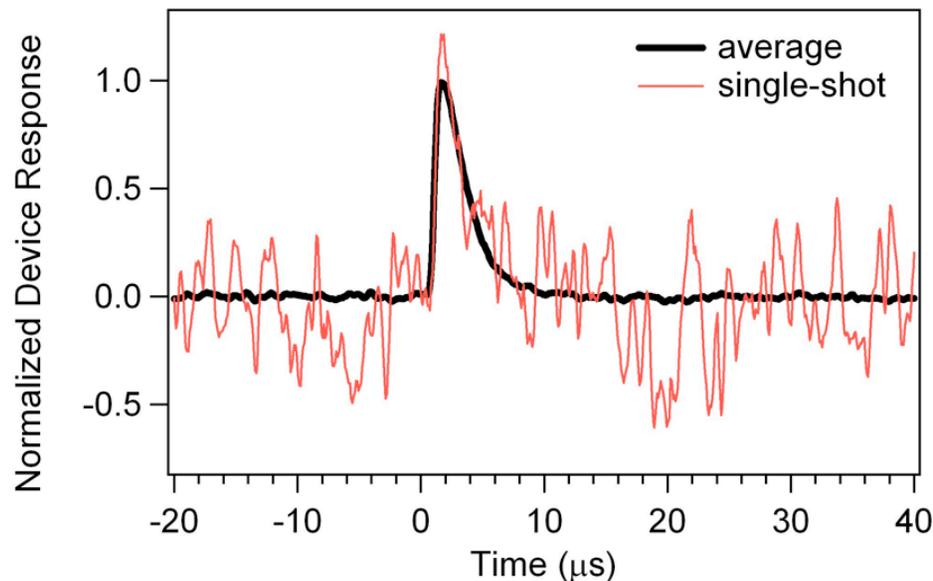

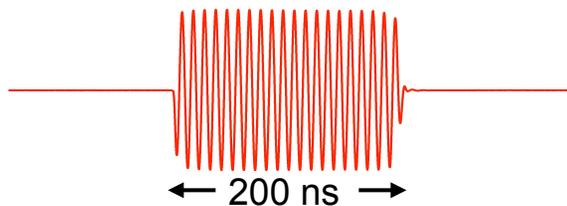

- photon counting  $> 1$  THz ( $\lambda = 300 \mu\text{m}$ ); Quantum-dot detector demonstrated; but only 1% detection efficiency, narrow range of  $E_{\text{ph}}$

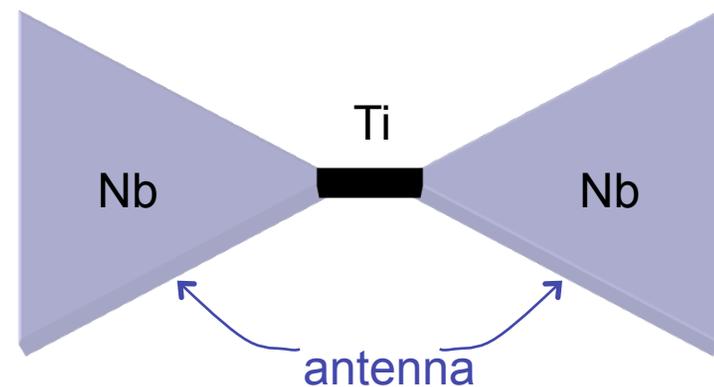

# Antenna-coupled nano-TES - testing with fauxtons

(faux photon) – a new “quanta” for single photon testing; real photons = very hard  
- see Karasik – has just seen real photons; Santavicca

Fast microwave (20 GHz) pulse; absorbed pulse energy (fauxton) = energy of single higher-freq. photon. Measure the reflection coefficient (due to change of R) at 1 GHz.

Leads (rf, dc) are not shown

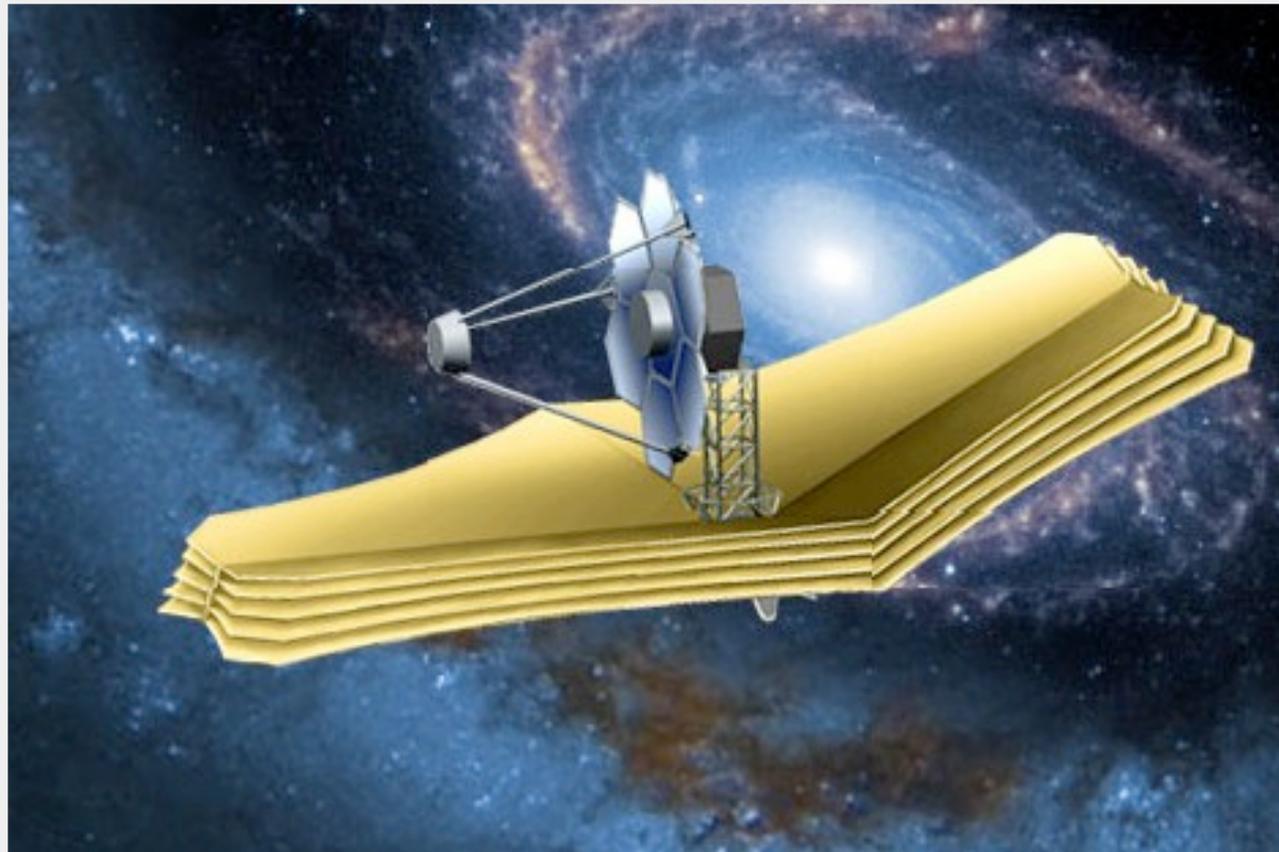

Based on measured performance, predict for smaller TES - single 1 THz (4 meV) photons can be counted!

D.Santavicca, Yale

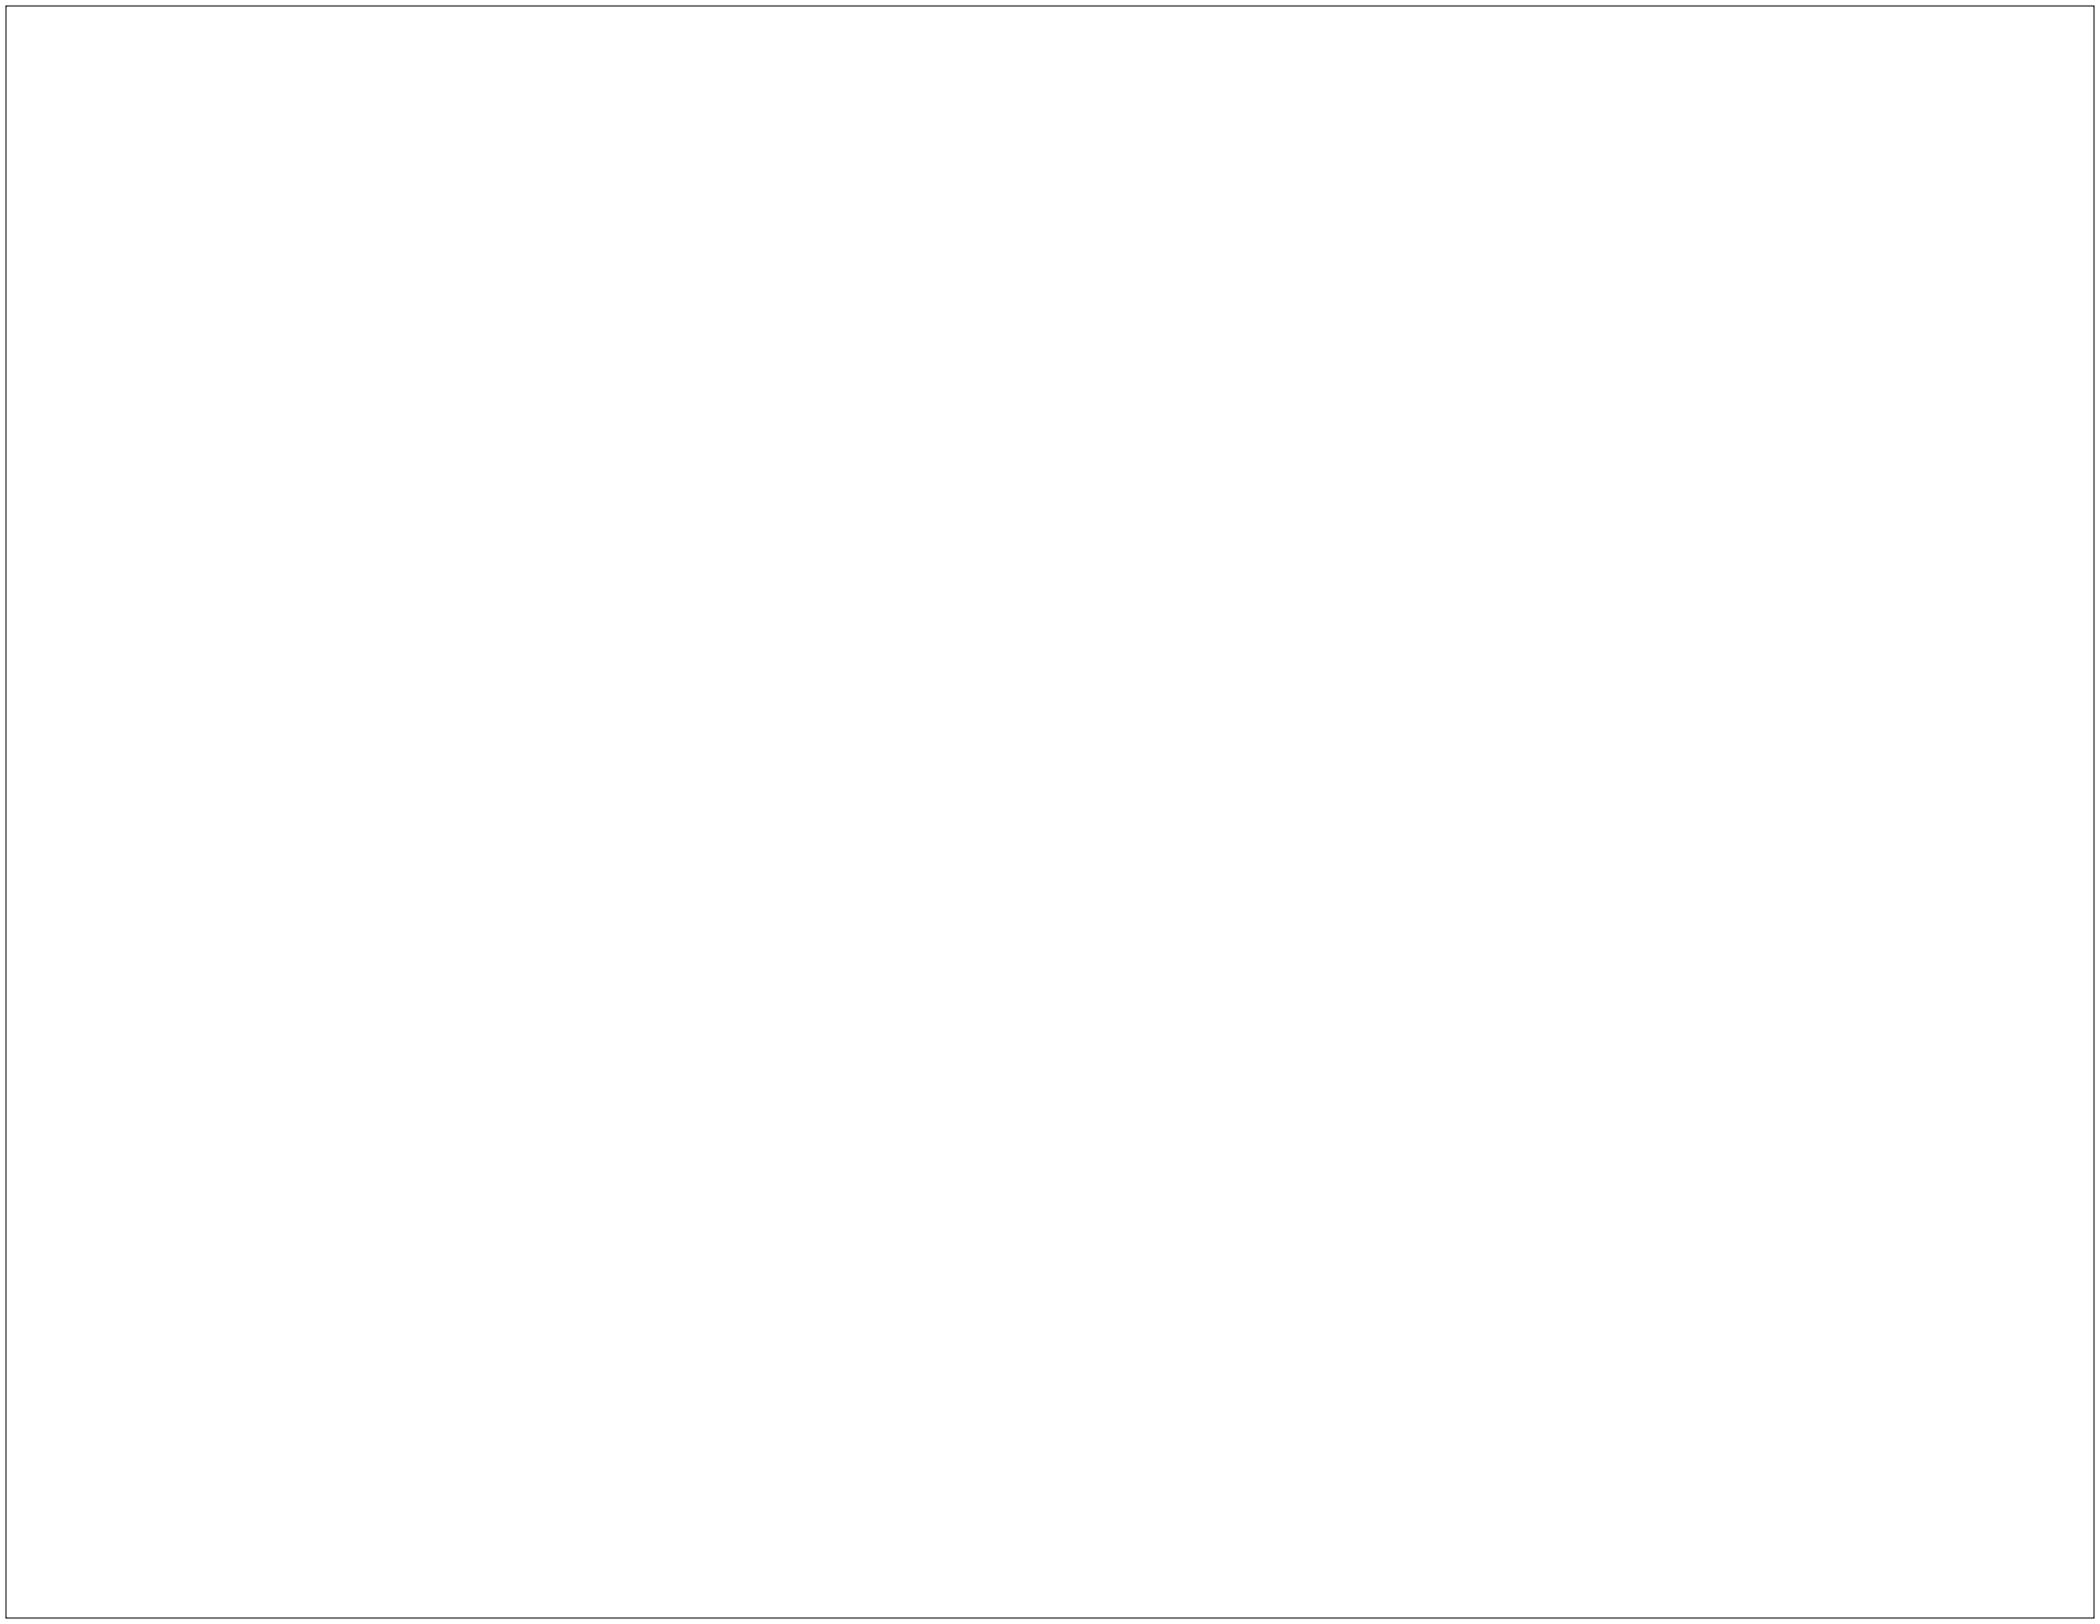

# Future sensitivity challenges in space

Future spectroscopic space missions featuring cryocooled (4-5 K) primary mirrors (e.g., SPICA, SAFIR, CALISTO, SPECS) will require a  $\sim 3$ -order of magnitude detector sensitivity improvement

- Photon integration below 1 THz
- Photon counting above 1 THz

Karasik&Sergeev, *IEEE Trans. Appl. Supercond.* 2005

SNSPD (new) <sup>87</sup>	1.5	57% @1,550 nm	30 ps	—	—	1 GHz	No	§
QD (resonant tunnel diode) <sup>96</sup>	4	12% @550 nm	150 ns	$2 \times 10^{-3}$ Hz	$4 \times 10^9$	250 kHz	No	§
QD (field-effect transistor) <sup>93</sup>	4	68% @805 nm	—	—	—	1 Hz	Yes	§

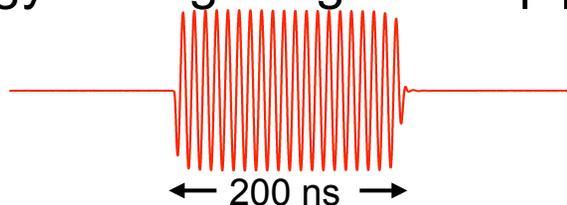

The class of report indicates the conditions under which the detector characteristics were measured;

# Antenna-coupled nano-TES

## - testing with Fauxtons

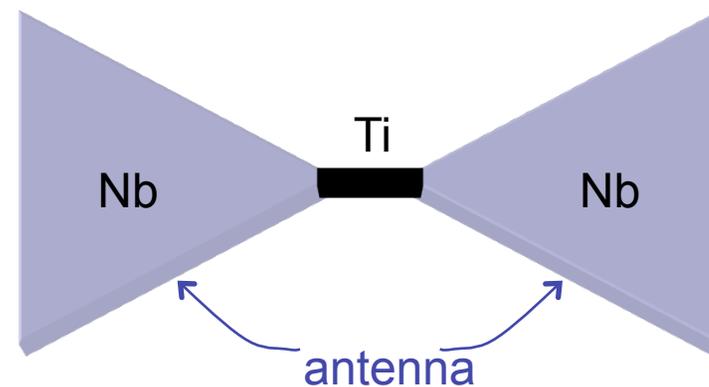

fauxton (faux photon) – a new “quanta” for single photon testing

Fast microwave (20 GHz) pulse;  
absorbed pulse energy (fauxton) =  
energy of single higher-freq. photon

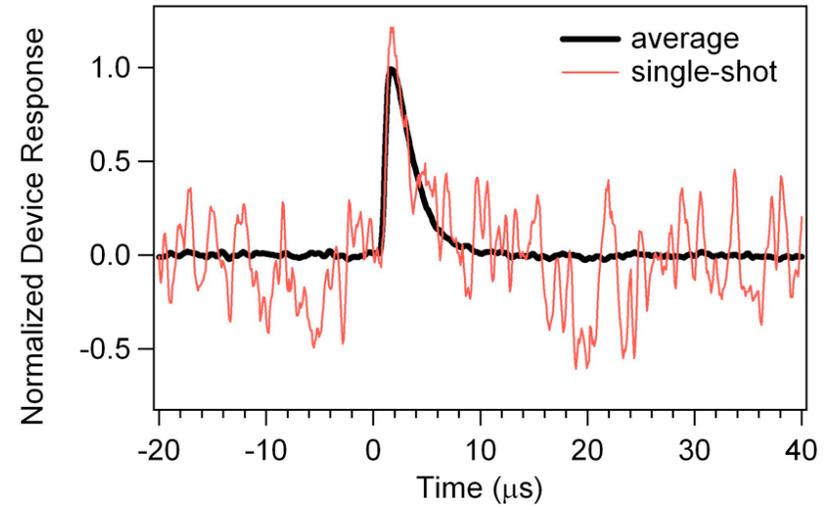

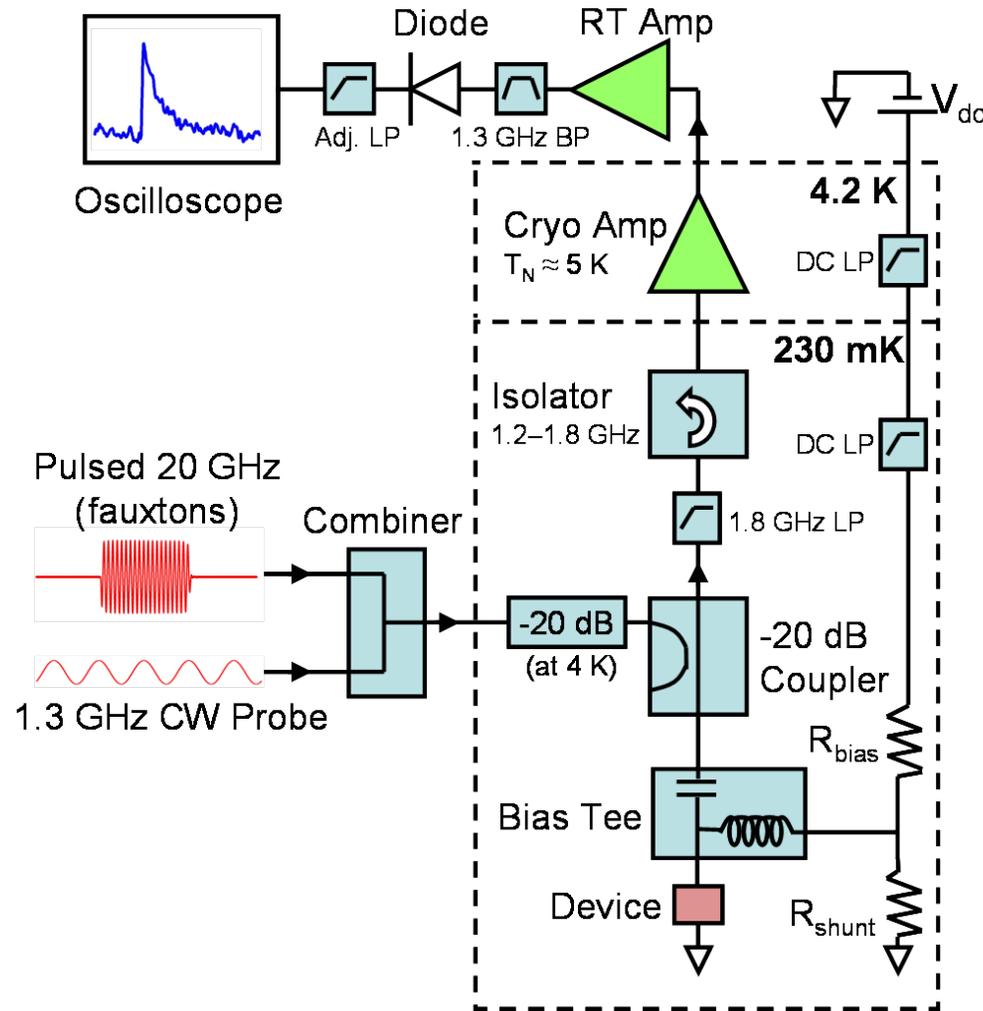

Readout by measuring the reflection coefficient at 1 GHz with low noise cryogenic microwave amplifier

Leads (rf, dc) are not shown

- Testing in a dark environment; no stray photons  $P \ll 1\text{fW}$
- Arbitrary tunability of fauxton energy
- Can “sneak up” on hardest problems; optimize device fabrication, performance, and signal processing while a THz single-photon test system is developed

# Testing with Fauxtons

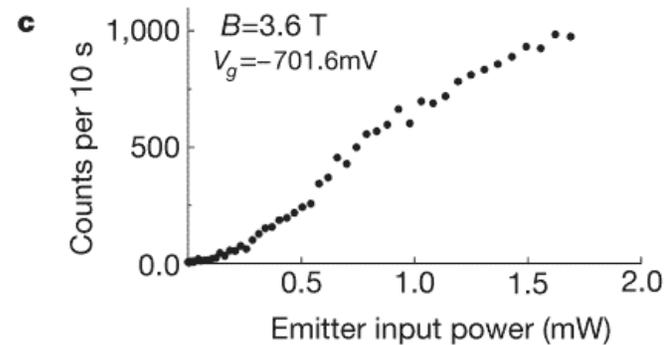

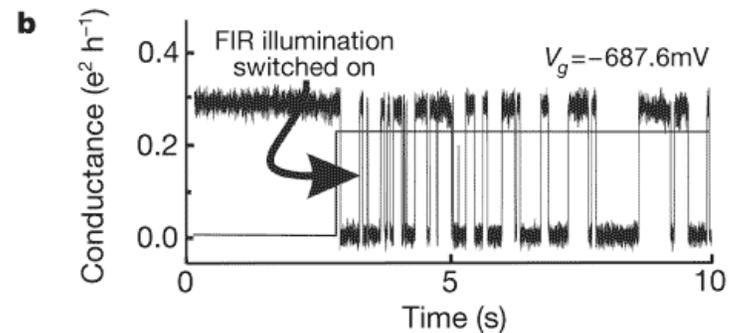

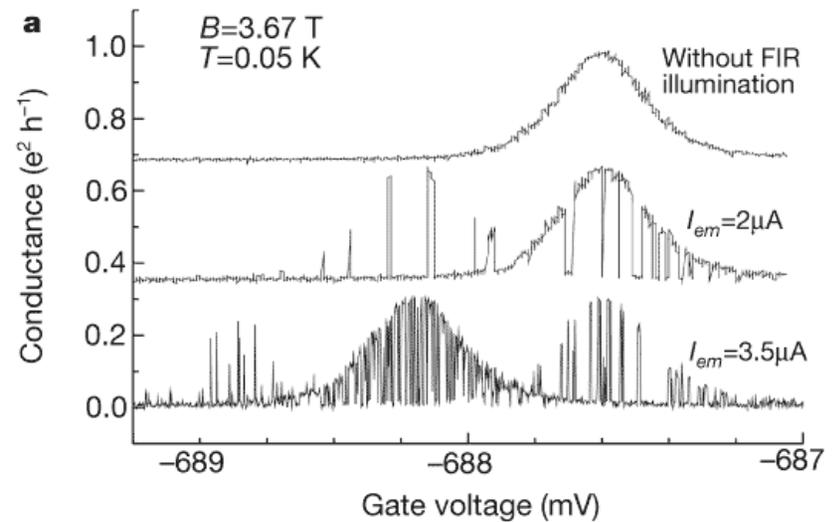

Experimental schematic for fauxton testing  
Trigger signal used

D.Santavicca, Yale

# Quantum Dot Detector

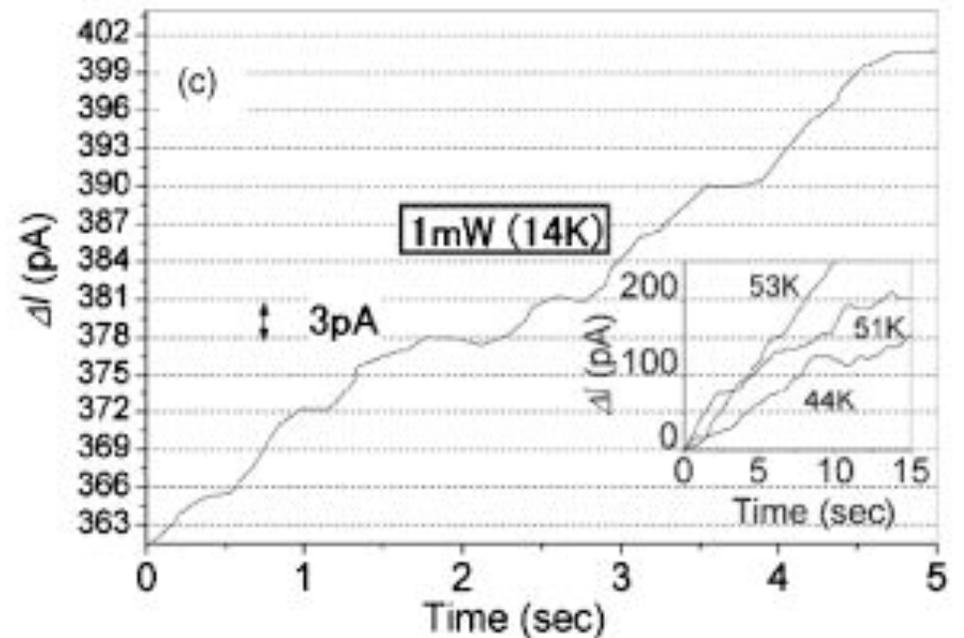

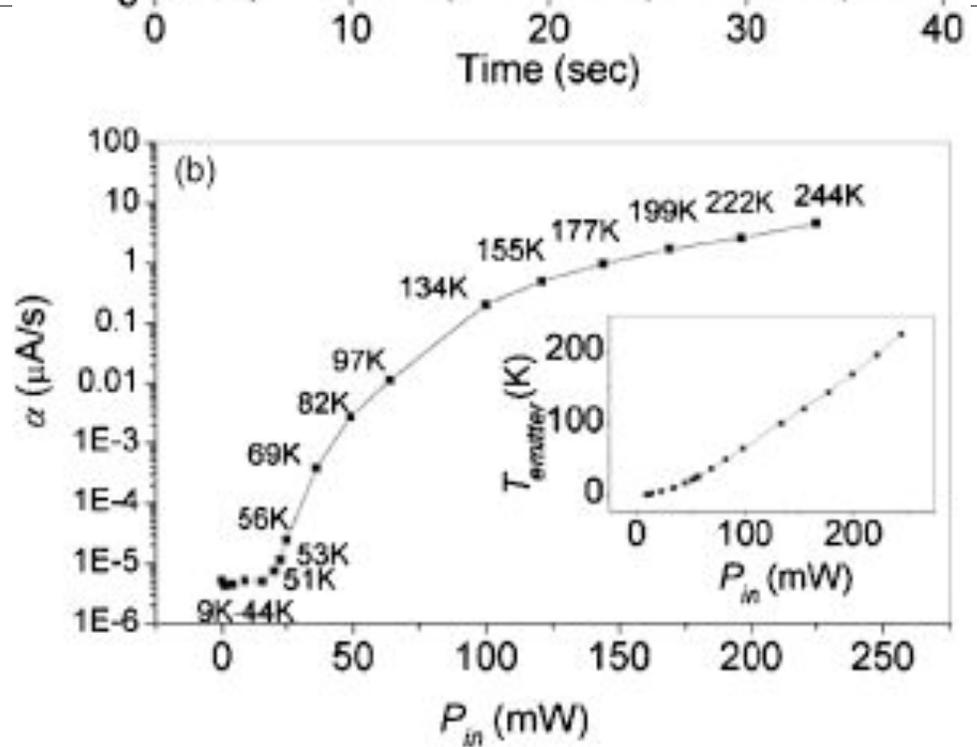

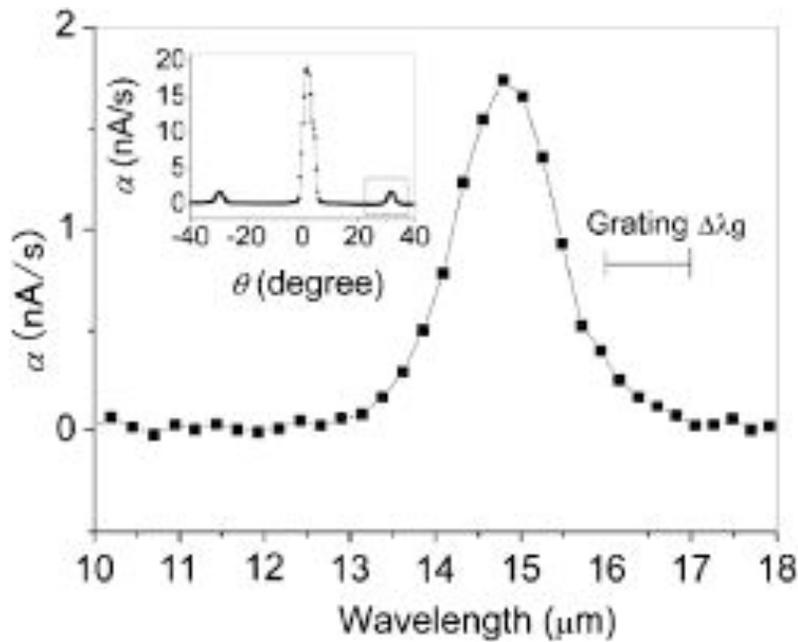

Transistor stays 'on' for a short time = counted photo eff. 2%

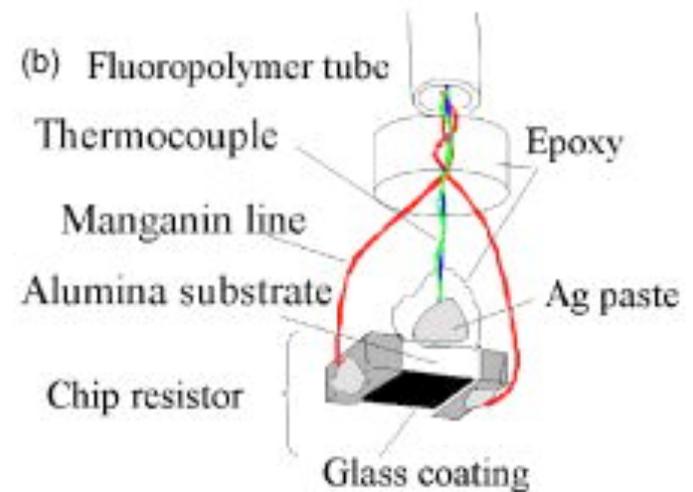

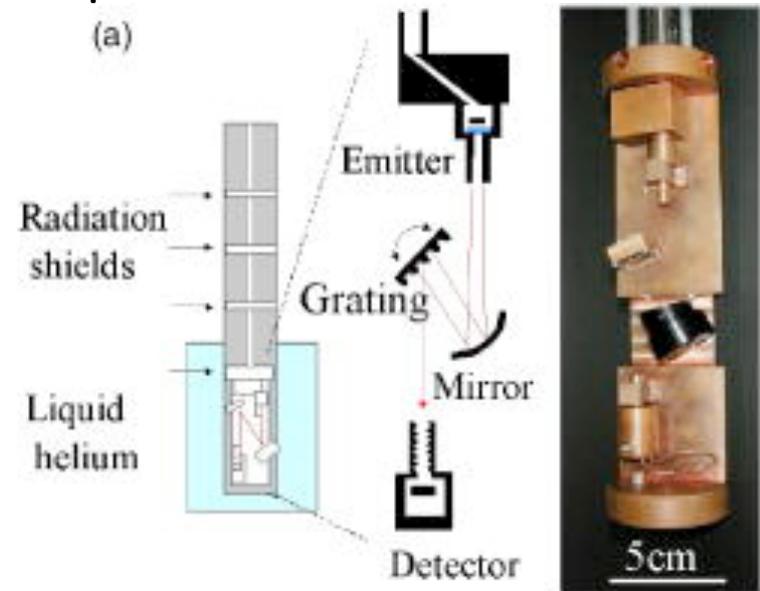

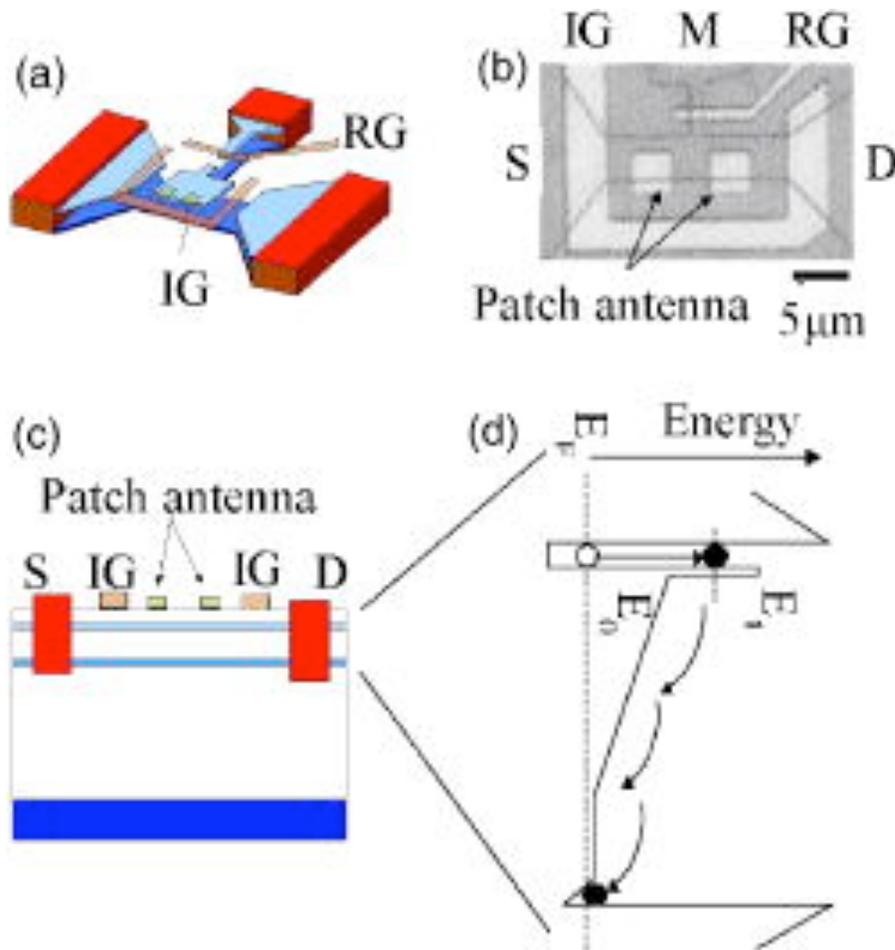

S. Komiyama et al. , Nature 403, 405 (2000)

# FIR: FET Results

Current due to 15  $\mu\text{m}$  photons increases during illumination, in steps of 3 pA (if you are charitable); note 360  $\mu\text{A}$  initial current. This is a VERY challenging detection goal!

# FIR excitation – $n_{\text{photon}}$ controls current of FET

Ueda et al. J. Appl. Phys. 103, 093109 (2008)

# TES $\alpha$ particle sensors: nuclear materials analysis

- J. Ullom, LTD13

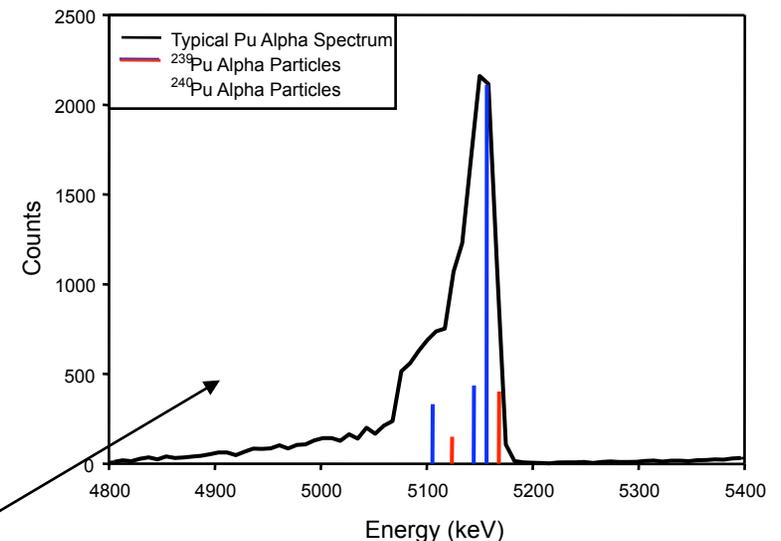

- alpha spectroscopy is a powerful tool for trace actinide measurements
  - environmental monitoring
  - nuclear safeguards
  - medical assay
- alpha branching ratios higher than  $\gamma$   $\Rightarrow$  used for smaller samples (ug-pg)
- $\sim 8$  keV resolution limit of Si detectors has consequences:
  - elemental overlaps  $\Rightarrow$  slow and expensive wet chemistry to separate elements
  - can't split  $^{239}\text{Pu}/^{240}\text{Pu}$   $\Rightarrow$  slow and expensive mass spectrometry

typical alpha samples

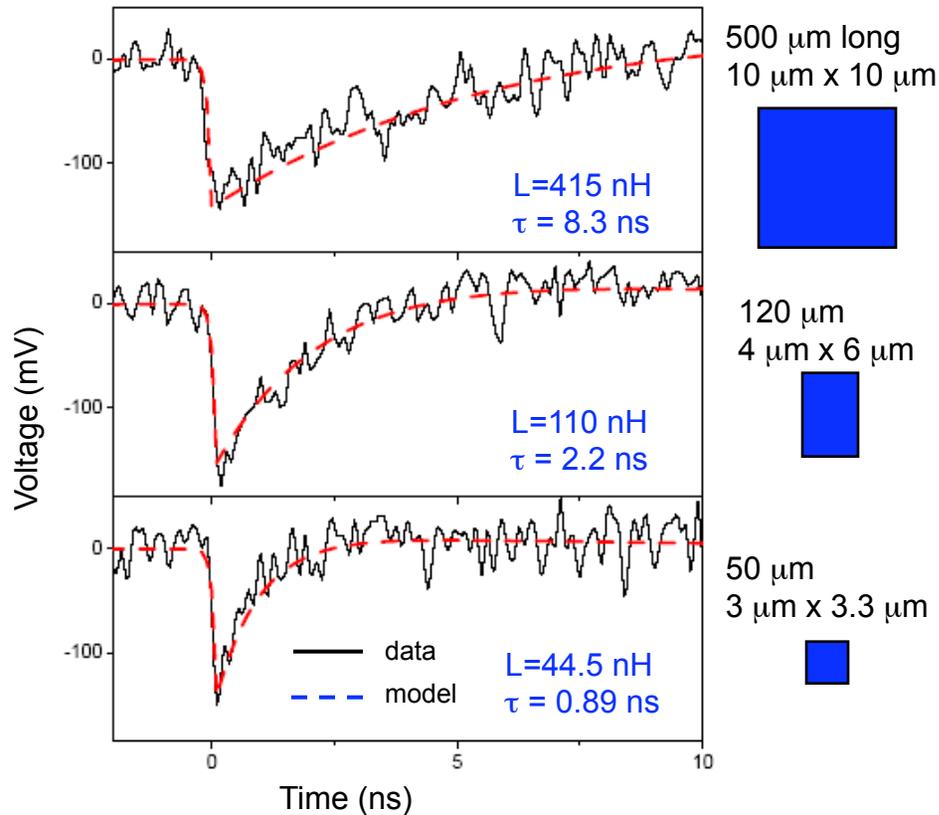

typical alpha spectrum

J. Ullom, LTD13

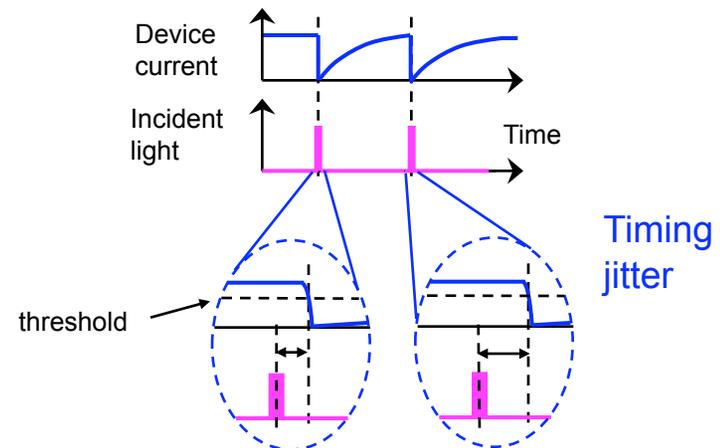

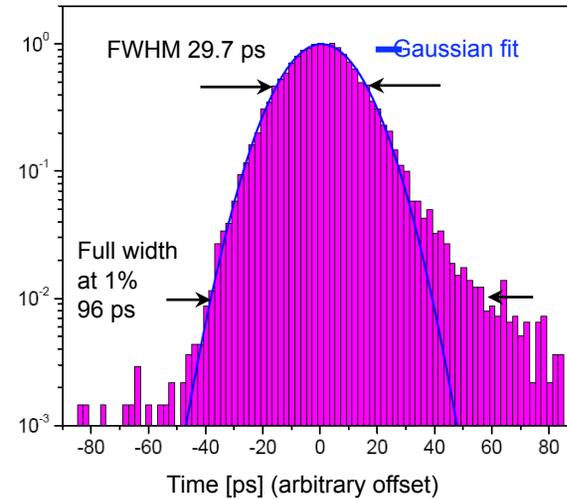

# Device Characteristics

Single-photon output pulses

Typical detection efficiency:  
40-60% at 1550 nm; T – 2-4 K

Measured timing jitter of device at T=1.8K  
 $\sim 1$  photon/pulse

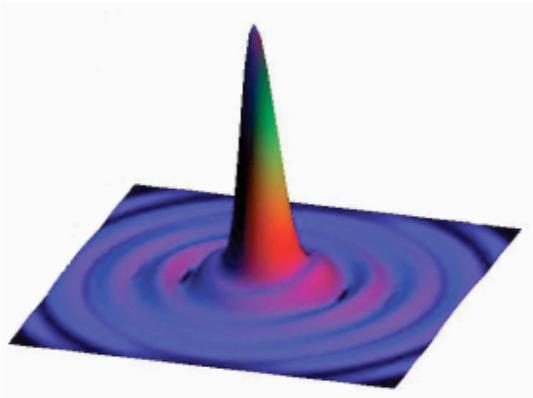

MIT LL data

# QKD – Quantum Key Distribution

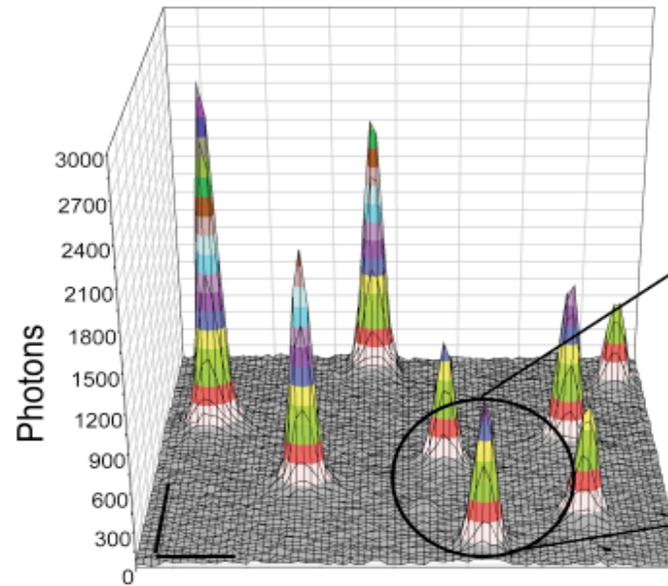

- Presently use InGaAs detectors over standard fiber = demo
- Tested in Swiss network (*id Quantique*) – also used single photon random number generator in voting authentication for Geneva
- Goal of QKD is to create a shared secret key that is then used to encrypt data.
- Transmission rates limited by detection efficiency, fiber losses over  $L \approx 100$  km, and (for fastest NbN nanowire detectors) standard electronics (electronics might not utilize the very small timing jitter of NbN detector)
- Nanowire – fast, good detection efficiency; good for QKD
- TES – higher DE, but too slow for QKD; good for other QI apps.

# Bio Applications – Single Molecule

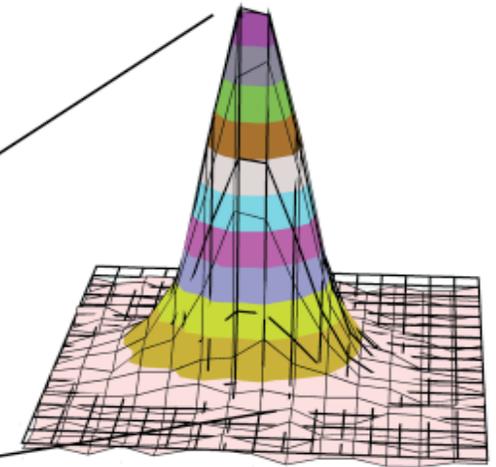

A

B

C

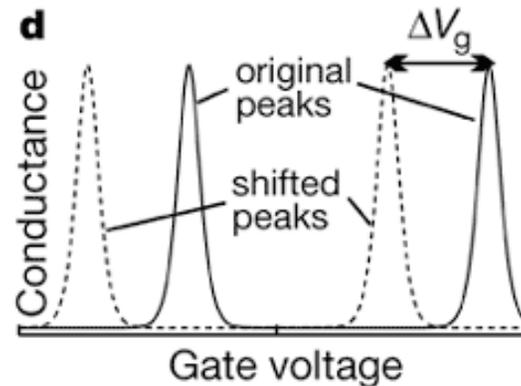

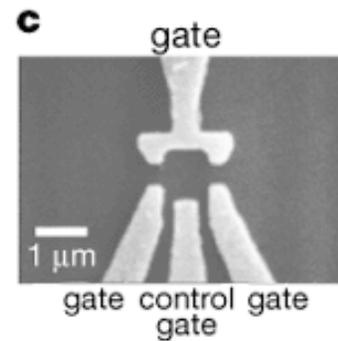

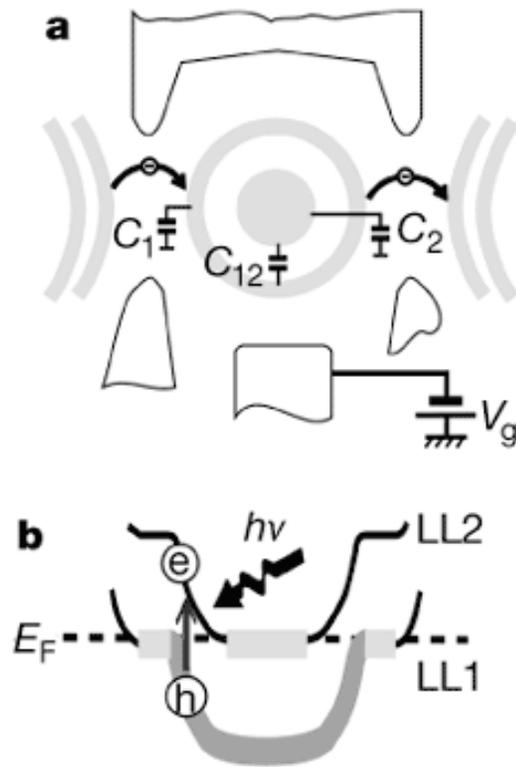

Yildiz Lab, UCB

# ICESat/GLAS - Ice, Cloud and land Elevation Satellite / Geoscience Laser Altimeter System (2003)

- Uses 5 ns pulses from a diode pumped Q-switched Nd:YAG laser operating in the near infrared (1064 nanometers), used for the measurement of surface topography.
- Backscattered light in the green (532 nanometers) for aerosols and other atmospheric characteristics.
- Return photons collected in a 1 meter diameter telescope and the laser transmits 40 pulses/s to the surface.
- The spots produced on the Earth's surface will have a 70 meter diameter and the spacing between spots will be 175 meters, caused by the orbital motion of the spacecraft.
- → Low power single-photon communication, distant.

# FIR Single-photon Detectors

## energies in solids, molecules. 1. Quantum Dot

SET – Quantum dot in center, use Landau levels to define  $hf$

Needs large B field, 50 mK; small range of  $E_{ph}$

Very cold, and small

Low Det. Eff. 2%

Recent work - FIR excitation  $\rightarrow$   
 $n_{\text{photon}}$  controls current of FET

S. Komiyama et al. , Nature 403, 405 (2000)
